14 June 2016

Table of contents

1. [Main points](#)
2. [A brief description of consumer price inflation](#)
3. [Consumer Prices Index \(CPI\)](#)
4. [CPIH](#)
5. [Retail Prices Index \(RPI\) and RPIJ](#)
6. [Guide to data](#)
7. [Background notes](#)

1 . Main points

The Consumer Prices Index (CPI) rose by 0.3% in the year to April 2016, down from 0.5% in the year to March.

From late 2015, the rate began to increase gradually from close to zero. The drop in April 2016 is the first fall since September 2015.

Falls in air fares and prices for clothing, vehicles and social housing rent were the main contributors to the decrease in the rate.

These downward pressures were partially offset by rising prices for motor fuels and for certain recreational goods and cultural services, and by food prices, which were unchanged between March and April 2016, having fallen between the same two months a year ago.

CPIH (not a National Statistic) grew by 0.6% in the year to April 2016, down from 0.7% in March.

2 . A brief description of consumer price inflation

Consumer price inflation is the rate at which the prices of goods and services bought by households rise or fall. It is estimated by using price indices. A way to understand this is to think of a very large shopping basket containing all the goods and services bought by households. Movements in price indices represent the changing cost of this basket. An [infographic](#) explains how consumer price inflation is calculated. Consumer price indices are published monthly.

A price index can be used to measure inflation in a number of ways. The most common is to look at how the index has changed over a year. This is calculated by comparing the price index for the latest month with the same month a year ago. This is known as the 12-month inflation rate. This bulletin measures inflation to April 2016, so the 12-month rate measures changes in prices between April 2015 and April 2016.

A range of measures of consumer price and other price inflation are published. [A tale of many price indices](#) summarises information on the different measures

3 . Consumer Prices Index (CPI)

What is the CPI?

The CPI is a measure of consumer price inflation produced to international standards and in line with European regulations. First published in 1997 as the Harmonised Index of Consumer Prices (HICP), the CPI is the inflation measure used in the government's target for inflation.

The CPI is also used for purposes such as uprating pensions, wages and benefits and can aid in the understanding of inflation on family budgets. For more information see [Users and uses of consumer price inflation statistics \(2013\)](#).

Latest figure and long-term trend

The CPI 12-month rate (the amount prices change over a year) between April 2015 and April 2016 stood at 0.3%. This means that a basket of goods and services that cost £100.00 in April 2015 would have cost £100.30 in April 2016.

2015 was a year of historically low inflation, with the rate being at or around zero for much of the year. The rate began to increase gradually in late 2015, reaching 0.5% in March 2016. The drop in April 2016 is the first fall since September 2015. Similar to 2015, the largest downward pulls on inflation continue to come from prices for food and non-alcoholic beverages, and transport. These downward pressures have been counterbalanced by an upward pull from price movements for other goods and services, most notably restaurant and hotel bills, and education costs such as university tuition fees.

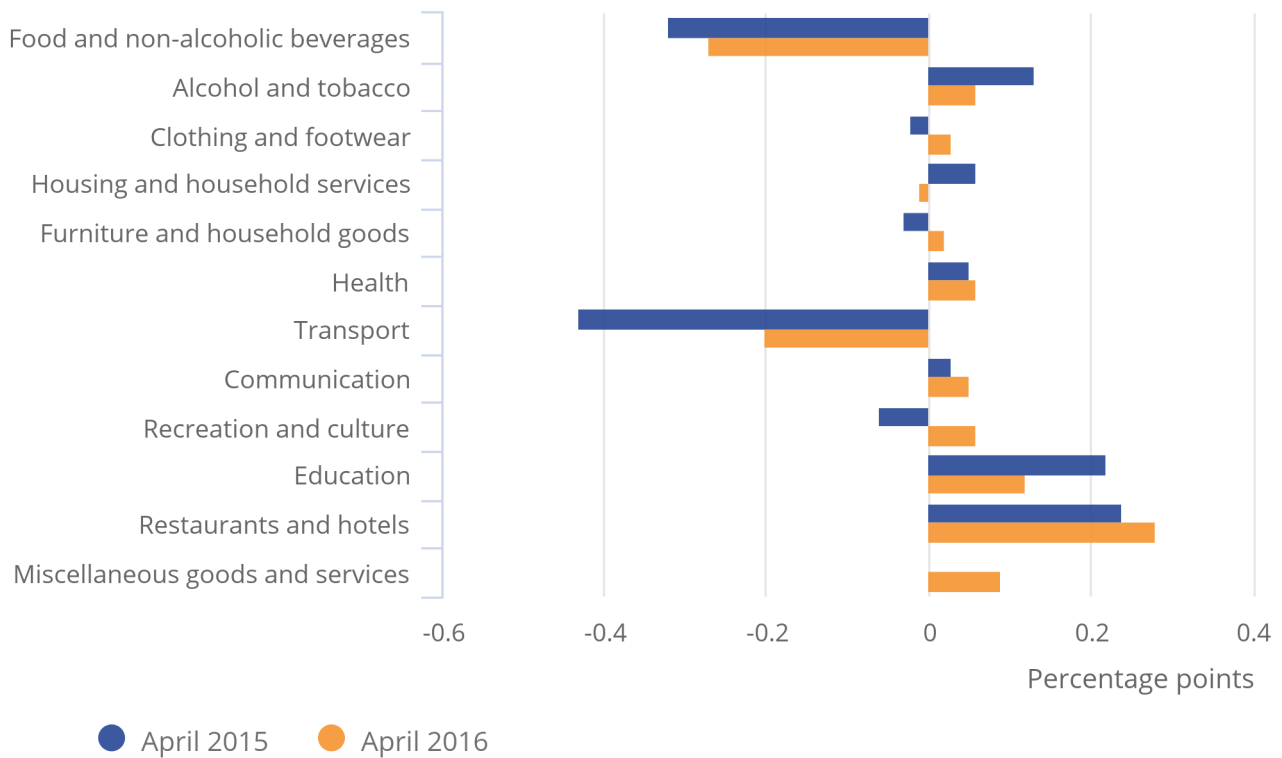

Figure A shows the contributions to the CPI 12-month rate in April 2016 compared with the contributions to the 12-month rate a year earlier.

Notes:

1. From February 2016, CPI and CPIH indices have been re-referenced and published with 2015=100. This does not impact on published inflation rates.

Consumer Prices Index (CPI): What are the main movements?

This section explains which goods and services had the biggest impact on the change to the 12-month rate between March and April 2016 and, where relevant, considers the longer-term inflationary trends for these goods and services.

The change in the CPI 12-month rate can be calculated by comparing the 12-month rates for 2 consecutive months. An alternative, and equally valid, approach is to calculate it by comparing the price change between the latest 2 months and the price change between the same 2 months a year ago. [Explaining the contribution to change in the 12-month rate \(2013\)](#) is a diagram explaining the calculation.

The CPI rose by 0.1% between March and April 2016, compared with a rise of 0.2% between the same 2 months a year earlier. The 1-month movement was therefore lower this year compared with a year ago, leading to a fall in the CPI 12-month rate.

Between March and April 2016, the main upward contributions to the change in the CPI 12-month rate came from the following groups.

Recreation and culture: prices, overall, rose by 0.8% compared with a rise of 0.2% between the same 2 months a year ago. The upward contribution came mainly from computer games, with prices rising between March and April 2016 compared with a fall last year, and from admission to cultural events, for which prices increased by more than they did a year ago.

Food and non-alcoholic beverages: the upward contribution came from food, with prices, overall, being unchanged between March and April 2016, having fallen by 0.4% a year ago. The overall upward contribution was due to smaller upward pressures across a variety of products.

The main downward contributions to the change in the CPI 12-month rate came from the following groups:

Transport: prices, overall, fell by 0.1% between March and April this year compared with a rise of 1.1% between the same 2 months a year ago. By far the largest downward effect came from air transport, with prices falling by 14.2% compared with a rise of 4.5% between the same 2 months last year. This is influenced by the timing of Easter, which contributed to a large increase in fares between February and March 2016, with a subsequent fall in April 2016. There was also a smaller downward effect from purchase of vehicles, particularly second-hand cars, for which prices fell between March and April 2016, compared with a rise between the same 2 months last year. These downward effects were partially offset by an upward contribution from motor fuels, with prices for both petrol and diesel rising by more than they did a year ago.

Clothing and footwear: the downward contribution came from clothing, with prices, overall, falling by 0.4% between March and April this year compared with a rise of 0.9% between the same 2 months a year ago. Much of the downward contribution came from women's outerwear.

Housing, water, electricity, gas and other fuels: prices, overall, fell by 0.2% between March and April 2016 compared with a rise of 0.4% between the same 2 months a year ago. The downward effect came mainly from social housing rent. This is likely to be due to changes that were announced in the Summer Budget 2015, in which social housing rent was set to decrease by 1% for the next 4 years, starting in April 2016.

Figure C shows the contributions to change from each part of the CPI basket of goods and services.

Notes:

1. Individual contributions may not sum to the total due to rounding
2. More information on the contents of each group can be found in Table 3 in the accompanying consumer price inflation dataset tables

4 . CPIH

CPIH has been re-assessed to evaluate the extent to which it meets the professional standards set out in the Code of Practice for Official Statistics and the [assessment report](#) published on 3 March 2016. The report includes a number of requirements that need to be implemented for CPIH to regain its status as a National Statistic. The actions taken to address these requirements will be reported to the UK Statistics Authority by September 2016.

CPIH is a measure of UK consumer price inflation that includes owner occupiers' housing costs (OOH). These are the costs of housing services associated with owning, maintaining and living in one's own home. OOH does not include costs such as utility bills, minor repairs and maintenance, which are already included in the index.

CPIH uses an approach called rental equivalence to measure OOH. Rental equivalence uses the rent paid for an equivalent house as a proxy for the costs faced by an owner occupier. In other words, this answers the question "how much would I have to pay in rent to live in a home like mine?" for an owner occupier. OOH does not seek to capture increases in house prices. Although this may be inconsistent with some users' expectations of measures of OOH, the inclusion of an asset price and therefore capital gains would make the index less suitable for a measure of consumption. OOH currently accounts for 16.5% of the expenditure weight of CPIH. This compares with a weight of 19.5% in 2005.

Currently, the method of calculation, the population coverage and the basket of goods and services are the same as the Consumer Prices Index (CPI), with the exception of OOH. The method of deriving the weights for CPIH and the data used for these are also the same as for CPI, with the exception of OOH. This can result in some differences from the CPI.

In April 2016, the 12-month rate (the rate at which prices increased between April 2015 and April 2016) for CPIH stood at 0.6%, down from 0.7% in March 2016. The difference between the CPI and CPIH annual rates in April 2016 was 0.3 percentage points, up from 0.2 percentage points in March. Owner occupiers' housing costs increased by 0.3% between March and April 2016, compared with 0.1% between these months a year earlier. This meant that they had a small upward impact on the change in the CPIH 12-month rate between the 2 months.

Figure D shows the CPIH and OOH component 12-month rates for the last 10 years. The CPI 12-month rate has been included for comparative purposes. Table B shows the CPIH and OOH component 1-month and 12-month rates and index values for the last year.

Notes:

1. From February 2016, CPI and CPIH indices have been re-referenced and published with 2015=100. This does not impact on published inflation rates.

2. CPIH has been re-assessed to evaluate the extent to which it meets the professional standards set out in the Code of Practice for Official Statistics. The assessment report includes a number of requirements that need to be implemented for CPIH to regain its status as a National Statistic

5 . Retail Prices Index (RPI) and RPIJ

In accordance with the Statistics and Registration Service Act 2007, the Retail Prices Index (RPI) and its derivatives have been assessed against the Code of Practice for Official Statistics and found not to meet the required standard for designation as National Statistics. The [full assessment report](#) can be found on the UK Statistics Authority website.

The RPI is a long-standing measure of UK inflation that has historically been used for a wide range of purposes such as the indexation of pensions, rents and index-linked gilts. For further information see [Users and uses of consumer price inflation statistics \(2013\)](#).

RPIJ is an improved variant of the RPI, which is calculated using formulae that meet international standards. The rationale for creating RPIJ was to give users a better alternative to the RPI if their needs were for a measure of inflation based on the same population, classifications, weights, etc as the RPI. Currently, RPIJ also acts as an analytical series in that it allows users to see the impact of using the Jevons (which meets international standards) in place of the Carli formula (which does not meet international standards) in the RPI. The use of the different formulae at the elementary aggregate level is currently the only difference between the 2 indices. Detailed goods and services indices are not produced for RPIJ.

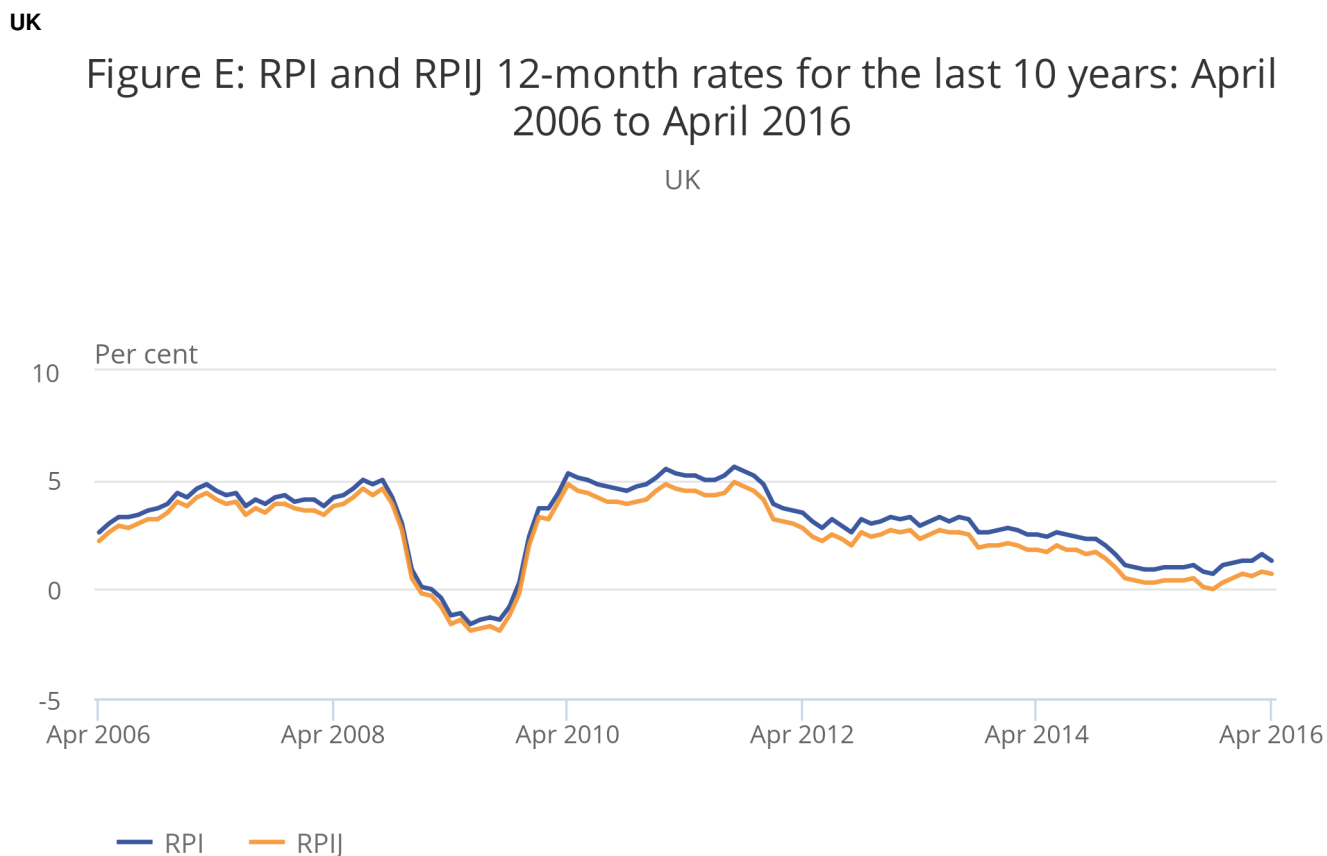

In April 2016, the 12-month rate for RPIJ stood at 0.7%, down from 0.8% in the year to March.

The RPI 12-month rate for April 2016 stood at 1.3%, meaning that it was 0.6 percentage points higher than it would have been had it used formulae that meet international standards.

Figure E shows the RPI and RPIJ 12-month rates for the last 10 years. Over this period the RPIJ 12-month rate has been, on average, 0.6 percentage points lower than the RPI.

Table C shows the RPI and RPIJ 1-month and 12-month rates and index values for the last year.

Figure E: RPI and RPIJ 12-month rates for the last 10 years: April 2006 to April 2016

Source: Office for National Statistics

Notes:

The RPI has been de-designated as a National Statistic

7. Background notes

1. News

Re-assessment of CPIH

CPIH has been re-assessed to evaluate the extent to which it meets the professional standards set out in the Code of Practice for Official Statistics and the [assessment report](#) published on 3 March 2016. The report includes a number of requirements that need to be implemented for CPIH to regain its status as a National Statistic. The actions taken to address these requirements will be reported to the UK Statistics Authority by September 2016.

2. Understanding and accessing the data

A full description of how consumer price indices are compiled is given in the [Consumer Price Indices technical manual](#). This is supplemented by infographics and further information available from the [guidance and methodology section](#) of our archived website.

A more detailed [quality report](#) for this statistical bulletin is available. The report assesses consumer price inflation statistics against standard dimensions of quality such as relevance, accuracy and accessibility. The report was last updated in October 2013.

The [mini Triennial Review](#) of the CPI and RPI Central Collection of Prices is available.

All consumer price inflation data, including Excel dataset, time series data and explorable datasets, can be found on the [dataset page](#).

To help users further, very detailed data are available, including the [individual price quotes \(for locally collected items only\) and item indices](#) that underpin the CPI. Please note, the data that are published are at a level which means that no individual retailer or service provider will be able to be identified. The data published cover January 1996 to December 2015. These data are updated once a quarter with around a 2-month lag with the latest CPI publication. For example, the data will next be updated when the May CPI is published on 14 June 2016, at which point the detailed data published will be extended to March 2016.

Internationally, the CPI is known as the Harmonised Index of Consumer Prices (HICP). HICPs are calculated in each member state of the European Union (EU) according to rules specified in a series of European regulations developed by the European Commission (Eurostat) in conjunction with the EU member states. Eurostat releases figures for the Harmonised Index of Consumer Prices (HICP) for the month of April 2016 for EU member states, together with an EU average, on 18 May 2016. A summary of the latest European data is available from [Eurostat's database tables](#). Further information on HICP for the EU, Euro area and other EU member states is available from [Eurostat's HICP web page](#).

3. Methods - CPI and other measures of inflation

The CPI, CPIH, RPIJ and RPI are compiled using the same underlying price data, based on a large and representative selection of around 700 individual goods and services for which price movements are measured in around 140 randomly selected areas throughout the UK. Around 180,000 separate price quotations are used every month to compile the indices. The outlets in which the prices are collected are selected randomly. Expenditure weights are held constant for 1 year at a time.

The selection of goods and services that are priced to compile these indices is reviewed annually. The contents of the 2016 basket are described in an article [Consumer Price Inflation: The 2016 Basket of Goods and Services](#). The expenditure weights used to compile the indices are also updated each year. Additional details of the updated weights for 2016 are available in an article published on 22 March 2016 entitled [Consumer Prices Index and Retail Prices Index – updating weights: 2016](#).

Rates of change for the CPI and CPIH are calculated from unrounded index levels, rather than from the published indices which are rounded to 1 decimal place. The use of unrounded indices increases the accuracy of the calculation. The unrounded index levels for the CPI and CPIH are available from Tables 63 and 64 of the [Consumer Price Inflation dataset](#). By contrast, rates of change for the RPI and RPIJ are calculated from the published rounded indices.

Further information on the methods used to construct the CPI, CPIH, RPI and RPIJ, including differences in the methods used for each index, can be found in the [Consumer Price Indices Technical Manual. Users and uses of consumer price inflation statistics \(2013\)](#) provides further details of how consumer price statistics are used more generally.

4. Revisions policy

On 15 October 2013, a [revisions policy](#) was published for the suite of consumer price inflation statistics. The policy reaffirms the existing practices for CPI and RPI and sets out the policies for the new CPIH and RPIJ measures. In summary, CPI, CPIH and RPIJ are revisable in theory though revisions only occur under exceptional circumstances. The RPI is never revised once published.

5. **Publication policy**

This bulletin includes the April 2016 data, collected on and around 12 April 2016. Future [publication dates](#) for this statistical bulletin are available to January 2018 (the publication of the December 2017 inflation figures). Publication dates from February 2017 onwards are provisional.

6. **Code of Practice**

[National Statistics](#) are produced to high professional standards set out in the [Code of Practice for Official Statistics](#). They undergo regular quality assurance reviews to ensure that they meet customer needs. They are produced free from any political interference and released according to the arrangements approved by the [UK Statistics Authority](#).

1 From the release of January data on 16 February 2016, CPI and CPIH indices will be re-referenced and published with 2015=100

2 More detailed CPI data are available at <http://www.ons.gov.uk>

3 The coverage of these categories was extended in January 2000; further extensions to coverage came into effect in January 2001 for health and miscellaneous goods and services; the coverage of miscellaneous goods and services was further extended with effect from January 2002.

1 From the release of January data on 16 February 2016, CPI and CPIH indices will be re-referenced and published with 2015=100.

2 More detailed CPI, CPIH, RPI and RPIJ data are available at: <http://www.ons.gov.uk>

3 The National Statistics status of CPIH has been discontinued pending work to investigate and improve the method for measuring owner occupiers' housing costs in this index. The improvements from the resulting development work were introduced as part of the February 2015 dataset with the historical series revised back to 2005.

4 In accordance with the Statistics and Registration Service Act 2007, the Retail Prices Index and its derivatives have been assessed against the code of Practice for Official Statistics and found not to meet the required standards for designation as National Statistics. A full report can be found at: <http://www.statisticsauthority.gov.uk/>

1 From the release of January data on 16 February 2016, CPI and CPIH indices will be re-referenced and published with 2015=100.

2 The National Statistics status of CPIH has been discontinued pending work to investigate and improve the method for measuring owner occupiers' housing costs in this index. The improvements from the resulting develop-
