# Capital stocks and fixed capital consumption, UK: 2013 

Annual estimates of the value and types of non-financial assets used in the production of goods or services within the UK economy and their loss in value over time.

Release date:
2 July 2014
Next release:
14 November 2014

## Table of contents

1. Key points
2. Overview
3. Background
4. Key terms
5. Changes to methodology
6. What do you think?
7. Capital stocks and consumption of fixed capital in detail
8. Analysis by institutional sector
9. Analysis by type of asset
10. Analysis by industry
11. Capital output ratio analysis
12. Net capital stocks per employed person
13. International comparisons
14. Background notes

## 1. Key points

- This is the first publication of capital stock estimates since 2010. Estimates of capital stocks and consumption of fixed capital are now produced using a new methodology, as explained in the methodological changes to the estimation of capital stocks and consumption of fixed capital and impact of the methodological changes to the estimation of capital stocks and consumption of fixed capital articles published in June and July 2014. Users are strongly advised to read these articles and the background notes of this release
- All data referred to in this bulletin are annual estimates of chained volume measures (CVM), unless specified otherwise
- The United Kingdom’s (UK) net capital stock was estimated at $£ 3.5$ trillion at the end of 2012. Between 1998 and 2007, annual growth averaged at $1.9 \%$ but this slowed between 2008 and 2012 to $1.1 \%$. Since 1997, estimates of net capital stocks increased by $£ 750$ billion (28\%)
- Consumption of fixed capital for the UK was estimated at $£ 183$ billion in 2012 , an increase of $£ 40$ billion ( $28 \%$ ) compared with 1997. However, the 2012 estimate remains $£ 13$ billion ( $6 \%$ ) below the 2007 peak for this series, having fallen during the economic downturn
- Services industries held an estimated $79 \%$ of total net capital stocks at the end of 2012
- In 2012 the level of net capital stock per employed person fell by $1 \%$ following a slowdown in growth in 2010 and 2011
- This release contains analysis of the capital stock to output ratio, and ratio of capital stock to employment

## 2. Overview

This is the first publication of capital stock estimates since 2010, as explained in the methodological changes to the estimation of capital stocks and consumption of fixed capital and impact of the methodological changes to the estimation of capital stocks and consumption of fixed capital articles published in June and July 2014. The information within these articles will assist users' interpretation of these statistics as there have been significant changes to methodology since the last release of these estimates in 2010. The background notes of this release contain further information on understanding and using the data. Users may also find the definitions in the 'key terms' section useful.

The estimates in this release cover the period 1997 to 2012. Estimates for 2013 will be published in the next release of these data in November 2014. Estimates for periods before 1997 are not yet available. ONS is working to re-instate these estimates and provide users with a longer time series. A progress update on the pre-1997 estimates will be included in the November 2014 publication.

All data referred to in this bulletin are annual estimates of chained volume measures (CVM). These are time series put in real terms by computing the volume of each year in the prices of the preceding year. The data are then chained together to obtain a time series of production figures from which the effect of price changes have been removed. The CVMs in this publication are referenced to 2010. Current Price estimates are available in the tables and time series dataset.

This bulletin is split into five main sections:

- Background
- Key terms
- Changes to methodology
- Capital stocks and consumption of fixed capital in detail
- Background notes

## 3 . Background

Capital stocks and the consumption of fixed capital are estimated using the Perpetual Inventory Method (PIM). The PIM models capital stocks and capital consumption from estimates of gross fixed capital formation (GFCF). It is described in greater detail in the background notes of this release.

Estimates of GFCF and its breakdowns by sector and asset (from 1997) are published separately in the quarterly Business Investment Statistical Release.

Image 1 shows how gross capital stocks are calculated using the PIM. The cumulative sum of net investment in assets (GFCF), i.e. the capital stock, is calculated by adding investment this period to the capital stock in the previous period and subtracting the value of assets which have reached the end of their useful life or that have been scrapped as a result of bankruptcy. The PIM replicates this process for each industry and asset combination for every year of data in the model.

Image 2 shows how net capital stocks are calculated. This is also a 'stock' measure and estimates the value at the end of the year. The same process that is used for the estimation of gross stocks is used; however, an additional component for depreciation (for example, from wear and tear) is subtracted from the gross value. This can be thought of as the quantity of assets 'used up' in a year. At the end of an asset's service life, its whole value has been 'used up', and it no longer contributes to the net (or gross) stock level.

The consumption of fixed capital is an estimate of a 'flow'. It represents the change in the value of assets during the year. Image 3 shows that it is made up of the sum of transfer costs (costs associated with purchasing or disposing of an asset) from GFCF, the depreciation or loss in value of assets due to usual wear and tear as well as the value of assets lost when companies go bankrupt. This value is calculated for each year within the model.

| GFCF: |
| :---: | :---: | :---: | :---: |
| Transfer costs | Amount of | Assets lost |
| :---: |
| assets used |
| up |$\quad=$| Consumption |
| :---: |
| due to fixed |
| scrappage |
| capital |

Further explanations of the terms used are available in the key terms section of this release.

Capital stocks and the consumption of fixed capital estimates are produced annually and used by ONS in the compilation of the UK National and Economic Accounts and Public Sector Finances. They are also used by the Bank of England (BoE), the Office for Budgetary Responsibility (OBR), Her Majesty's Treasury (HMT), the Department for Business, Innovation and Skills (BIS), the Statistical Office of the European Union (Eurostat), business and research communities, educational communities, the media and the general public. These estimates are used to monitor economic performance and inform monetary and fiscal policy decisions, as well as for international comparisons.

## 4 . Key terms

- Capital stocks represent the value of all fixed assets used in production in the economy that are still in use, such as machinery, dwellings and intangible fixed assets such as software
- Economic assets are a store of value representing the benefits the economic owner will get by holding or using the asset over a period of time
- Fixed assets are non-financial items which are used repeatedly in the process of production for more than one year, for example, a machine on a production line or software used in production
- Gross capital stocks tell us how much the economy's assets would cost to buy again as new, or their replacement cost. All of the fixed assets in the economy, that are still productive and in use, are added up to calculate this, regardless of how old they are or how much they may have deteriorated since they were first used. This measure shows the value at the end of the quarter or year. This is mainly calculated as an intermediate step towards net capital stocks but individually provides a broad indicator of the productive capacity of an economy
- Net capital stocks show the market value of fixed assets. The market value is the amount that the assets could be sold for, which will be lower than the value of gross capital stocks. This reflects the fact that the assets will have had some wear and tear compared to a new asset. This measure shows the value at the end of the quarter or year. This measure is used in preference to gross capital stocks as it provides a valuation of assets in the economy after depreciation has been removed
- The consumption of fixed capital is the decline in the value, or depreciation, of fixed assets in the economy over a time period. The decline in value can be due to wear and tear, assets no longer being used, or normal accidental damage. It can also be described as the quantity (or value) of the capital stocks which is used up in that period. Whilst these data are interesting, their primary purpose is to move from various gross measures of economic flows to the corresponding "net" variable, in particular for production and income (net domestic product, net value added) and a number of demand variables such as net investment
- Gross fixed capital formation (GFCF) is the acquisition less disposals of produced fixed assets; that is assets intended for use in the production of other goods and services for a period of more than a year. Acquisition includes both purchases of assets (new or second-hand) and the construction of assets by producers for their own use. New buildings and dwellings, and major improvements to buildings and dwellings are included in GFCF, but the acquisition and disposal of existing buildings and dwellings are not
- Current prices (CP), also known as nominal terms, are the value for an item expressed in terms of the prices of that period, for example the cost of a new machine bought in 1998 in 1998 prices
- Constant price (KP) series have had the effects of inflation or deflation removed by fixing the prices of goods and services in one period (the base year), so that only the volumes change. For example the cost of a new machine bought in 1998 in 2009 prices
- Chained volume measures (CVM) are a series of economic data from successive years put in real terms by computing the production volume for each year in the prices of the preceding year. The data are then chain linked together to obtain a time-series of production figures from which the effects of price changes (that is, monetary inflation or deflation) have been removed. In other words, a series is obtained from the raw data which reflects only the production volume
- Institutional sectors are defined in the System of National Accounts (SNA) glossary as: units that are grouped together to form institutional sectors; on the basis of their principal functions, behaviour and objectives

The institutional units of the UK that make up the total economy are grouped into five mutually exclusive sectors:

1. Non-financial corporations
2. Financial corporations
3. General government
4. Non-profit institutions serving households
5. Households

In the case of the non-financial sector, it can be further broken down into the private sector (those units controlled by private individuals or groups), and public corporations (units controlled by the state).

## 5 . Changes to methodology

There have been a number of improvements and key changes to the methodology for estimating capital stocks and the consumption of fixed capital. The most significant changes are summarised below:

- changes to the estimation of GFCF - there have been significant changes to the estimation of GFCF since the 2010 publication. These, and their impact on estimates of GFCF, are described in detail in the article Explaining UK Investment Estimates: past, present \& future ( 654.1 Kb Pdf) , published in March, 2014
- the inclusion of cultivated assets in the estimates for the first time
- new data sources for artistic originals and operating surplus mark-up for own account software
- changes to the Standard Industrial Classification (SIC) - this has been updated from SIC 2003 to SIC 2007, and has an impact on the industry breakdowns
- changes to the level of detail in the PIM - now processes data for series at the asset by industry level, with no further breakdown by institutional sector. In the 2010 estimates, processing in the PIM was carried out at the asset by industry by sector level
- changes to the methods for estimation of breakdowns by institutional sector - now estimated using fixed proportions, rather than being processed throughout at the sector level
- changes to the deflation methodology - now uses the GFCF weighted asset deflators implemented for GFCF in Blue Book 2013 (1997-present), which replaces the 2010 asset by industry deflators

The key areas of improvements still to be implemented are:

- restore consistency with other National Accounts publications - due in Blue Book 2014. These estimates are not consistent with the 2013 United Kingdom National Accounts (Blue Book). These estimates have been produced using Blue Book 2013 GFCF methods (see Explaining UK Investment Estimates: past, present \& future) plus reconverted GFCF source data, for all years, from SIC 2003 to SIC 2007; the data does not include European System of Accounts (ESA) 2010 changes. Consistency will be restored with the next publication of this release (scheduled for November 2014), which will be consistent with the estimates used in Blue Book 2014 (including ESA10 changes)
- produce estimates for General, Central and Local Government using the new methodology. As consequence of Blue Book 2014 timetable constraints, ONS has been unable to fully implement the new methodology to produce estimates for the central and local government sectors. As a result, the sector totals used in the previous publication in 2010 have been maintained and the estimates for 2010 to 2012 have been forecast for these sectors based on historic trends. A key input to the estimates of capital stocks and the consumption of fixed capital are gross fixed capital formation (GFCF) investment estimates which come from sample surveys and administrative sources. This means that any updates to gross fixed capital formation (GFCF) for these sectors are not reflected in this release. All other sectors have been produced using ONS' new system and methods. ONS will aim to resolve this issue in time for the publication of Blue Book 2016
- provide a breakdown for institutional sector non-financial corporations (S.11) into public corporations (S. 11001) and private non-financial corporations (S.11PR). It has not been possible to provide a breakdown of the institutional sector non-financial corporations (S.11), into public corporations (S.11001) and private nonfinancial corporations (S.11PR). ONS will provide an institutional sector breakdown into S. 11001 and S. 11PR in Capital Stocks, Consumption of Fixed Capital, 2014 to be published in November 2014. ONS will aim to provide a breakdown by asset for both of these institutional sectors in time for the publication of Blue Book 2016
- fully introduce new data for NPISH. In these estimates and for Blue Book 2014, ONS has implemented the new methodology to produce estimates for the non-profit institutions serving households (NPISH) sector. NPISH includes for example charities and trade unions. However, the NPISH data from the PIM model were fixed at an early stage of the production process due to deliveries required to meet the Blue Book 2014 timetable. NPISH estimates have not been re-calculated by the PIM since this time, therefore they are inconsistent with the outputs for other non-government sectors. ONS plans to remove this inconsistency when the National Accounts revision policy allows

For a full description of the changes, and an assessment of the impact they have had on the estimates of capital stocks and the consumption of fixed capital, please see the methodological changes to the estimation of capital stocks and consumption of fixed capital and impact of the methodological changes to the estimation of capital stocks and consumption of fixed capital articles published on 25 June and 02 July 2014.

## Consistency with other publications

These estimates are not consistent with the 2013 United Kingdom National Accounts (Blue Book). These estimates have been produced using Blue Book 2013 GFCF methods (see Explaining UK Investment Estimates: past, present \& future) plus reconverted GFCF source data, for all years, from SIC 2003 to SIC 2007; the data does not include European System of Accounts (ESA) 2010 changes. Consistency will be restored with the next publication of this release (scheduled for November 2014) which will be consistent with the estimates used in Blue Book 2014 (including ESA10 changes).

As a consequence of the Blue Book 2014 delivery timetable, ONS has been unable to fully implement the new methodology to produce estimates for the central and local government sectors. As a result, the sector totals last published in 2010 (for these sectors only) have not been revised. Estimates for 2010 to 2012 have been forecast, based on historic trends. As such, any updates to GFCF for these sectors are not reflected in this release.

ONS has also been unable to provide an institutional sector and asset breakdown of non-financial corporations (S. 11), into public corporations (S.11001) and private non-financial corporations (S.11PR). This was also due to the constraints of the Blue Book 2014 delivery timetable and the requirement for additional quality assurance of the asset breakdowns.

All estimates cited in this publication are available for download in the accompanying time series dataset and in the publication tables.

## 6 . What do you think?

ONS are striving to improve this release and its associated commentary. We would welcome any feedback you may have, and would be particularly interested in knowing how you make use of these data to inform your work. Please contact us via email: gct@ons.gov.uk or telephone Wesley Harris on +44 (0)1633 455250.

## 7. Capital stocks and consumption of fixed capital in detail

Estimates of capital stocks and the consumption of fixed capital tend to follow a relatively smooth path over time, because they are recorded as accumulated balances. Nevertheless, in cases where the asset price or GFCF have changed significantly, changes in the rate of increase or decrease in the capital stock can be observed.

Although the level of real fixed GFCF investment fell sharply during the economic downturn, by $6.9 \%$ in 2008 and $16.7 \%$ in 2009, capital stock growth remained positive during these years. This is because despite falling sharply, the level (or flow) of fixed GFCF investment remained positive and above the level of depreciation in the capital stock. This meant that both gross and net capital stock continued to grow in 2008 and 2009, albeit at slower rates compared with the decade prior to the downturn.

Estimates of gross and net capital stocks, and the consumption of fixed capital are available in both CP and CVMs in the accompanying time series dataset and in the publication tables.

## Gross capital stocks

The chained volume measure of UK gross capital stocks was estimated at $£ 6$ trillion at the end of 2012, an increase of $33 \%$ since 1997 (equivalent to $1.9 \%$ growth per annum). In the decade prior to the economic downturn, gross capital stock rose on average by $2.1 \%$ per annum, however this slowed to $1.5 \%$ per annum between 2007 and 2009. In subsequent years, gross capital stock growth increased but, on average, remained below rates seen prior to the downturn (see Table 1).

Table 1: Average annual growth in the capital stock chained volume measures

Reference year: 2010 Coverage: United Kingdom

|  | $1998-$ <br> 2007 | $2008-$ <br> 2009 | $2010-$ <br> 2012 | $1998-$ <br> 2012 |
| :--- | ---: | ---: | ---: | ---: |
| Gross stock | $2.1 \%$ | $1.5 \%$ | $1.7 \%$ | $1.9 \%$ |
| Net stock | $1.9 \%$ | $1.1 \%$ | $1.1 \%$ | $1.6 \%$ |
| Consumption of fixed <br> capital | $3.2 \%$ | $-5.0 \%$ | $1.2 \%$ | $1.7 \%$ |

Source: Office for National Statistics

## Net capital stocks

Net capital stocks account for the depreciation in assets, so both the level and the rate of increase in the net stock will be lower compared with gross stock (figure 1). Chained volume measures of UK net capital stocks were estimated at $£ 3.5$ trillion at the end of 2012, an increase of $28 \%$ since 1997 (equivalent to $1.6 \%$ growth per annum).

As with the gross capital stock estimates, net capital stock growth also slowed during the economic downturn, to an annual average growth rate of $1.1 \%$ compared with $1.9 \%$ annual growth prior to the downturn. Growth in subsequent years remained subdued, with net stock rising by just $0.7 \%$ and $1.1 \%$ in 2011 and 2012 respectively.

Figure 1: Gross and net capital stocks chained volume measures
Reference year: 2010 Coverage: United Kingdom

## Figure 1: Gross and net capital stocks chained volume measures <br> Reference year: 2010 Coverage: United Kingdom

[^0]
## Consumption of fixed capital

At the end of 2012, the chained volume measure of UK consumption of fixed capital was estimated at £183 billion, an increase of $28 \%$ since 1997 (equivalent to $1.7 \%$ growth per annum). In contrast with the gross and net capital stock estimates, capital consumption is a flow variable and showed negative growth during the economic downturn. The level of consumption of fixed capital peaked in 2007 at $£ 196$ billion, but fell by $7.4 \%$ and $2.6 \%$ in 2008 and 2009 respectively to reach $£ 176$ billion in 2009 . This was caused by a sharp fall in household transfer costs (costs associated with purchasing or disposing of an asset), which can be attributed to the adverse impact of the financial market shock on the housing market. Growth in the consumption of fixed capital subsequently picked up, albeit at a slower rate compared with pre-downturn rates. In 2012, the level of the consumption of fixed capital was £13 billion lower than the 2007 peak (see Figure 2).

Figure 2: Consumption of fixed capital estimates chained volume measures
Reference year: 2010 Coverage: United Kingdom

## Figure 2: Consumption of fixed capital estimates chained volume measures <br> Reference year: 2010 Coverage: United Kingdom

## Source: Office for National Statistics

Also published as part of this release are estimates of the gross capital stock, net capital stock, and consumption of fixed capital at an institutional sector, asset and industry level. Further information on the detailed classification of these three areas can be found in the ONS 'concepts, sources and methods' publication.

## 8 . Analysis by institutional sector

The percentage share of net capital stocks owned by the institutional sectors remained relatively stable between 1997 and 2012 in CVM terms. The net capital stocks estimates have been used for this analysis because it is a measure of the market value of fixed assets, that is, what these assets were worth at the time. Users will notice a large change in estimates of 'other machinery and equipment', in non-financial corporations (S.11) and central government (S.13) in 2005. This was due to the reclassification of British Nuclear Fuels Limited (BNFL) in April 2005 - more information is available in the background notes.

At the end of 2012, non-financial corporations (NFCs) were estimated to have held the largest share of total net capital stock at $£ 1.5$ trillion ( $43 \%$ ), followed by the households and non-profit institutions serving households (NPISH) sector which held an estimated $£ 1.3$ trillion (38\%) of assets.

Within this, NFCs held the largest number of assets in 'other buildings and structures', at $£ 805$ billion ( $54 \%$ of total net capital stock held by NFCs). Households and NPISH primarily held assets in dwellings (excluding land) at $£ 1.3$ trillion ( $96 \%$ of total net capital stock held by households).

Figure 3: Net capital stocks by institutional sector, 1997 and 2012, chained volume measures
Reference year: 2010 Coverage: United Kingdom

# Figure 3: Net capital stocks by institutional sector, 1997 and 2012, chained volume measures <br> Reference year: 2010 Coverage: United Kingdom 

## Source: Office for National Statistics

Notes:

1. (a) NPISH stands for non-profit institutions serving households, such as universities and charities. (b) General Government (i.e. Central and Local Government) sectors have been forecast based on historic trends, any updates to GFCF for these sectors are not reflected in the estimates in this release - see changes to methodology section for further details

Figure 3 and Table 2 show that all institutional sectors experienced growth in net capital stocks between 1997 and 2012, albeit at different rates. In percentage terms, general government experienced the strongest growth at $56 \%$ (equivalent to $3.0 \%$ per annum), followed by NFCs at $27 \%$ (equivalent to $1.6 \%$ per annum) and financial corporations, which rose by $24 \%$ (an increase of $1.5 \%$ per annum). Households and NPISH increased by 19\%, or $1.2 \%$ per annum.

Table 2 shows that the economic downturn affected the growth of net capital stock to varying degrees by institutional sectors. For example, growth in net capital stock held by financial corporations was adversely affected by the downturn, falling from 2.0\% per annum in the pre-downturn decade, to $0.8 \%$ in 2008 and 2009 before falling again to just $0.3 \%$ on average in subsequent years. In contrast, growth in net capital stock held by general government remained stable during the downturn at $2.6 \%$, before rising strongly in subsequent years.

Table 2: Average annual growth in the net capital stock by institutional sector
Chained Volume Measures

|  | $1998-$ <br> 2007 | $2008-$ <br> 2009 | $2010-$ <br> 2012 | $1998-$ <br> 2012 |
| :--- | ---: | ---: | ---: | ---: |
| Non-financial <br> corporations | $1.9 \%$ | $1.2 \%$ | $0.8 \%$ | $1.6 \%$ |
| Households and NPISH | $1.6 \%$ | $0.5 \%$ | $0.0 \%$ | $1.2 \%$ |
| General Government | $2.6 \%$ | $2.6 \%$ | $4.6 \%$ | $3.0 \%$ |
| Financial corporations | $2.0 \%$ | $0.8 \%$ | $0.3 \%$ | $1.5 \%$ |
| Total net capital stock | $1.9 \%$ | $1.1 \%$ | $1.1 \%$ | $1.6 \%$ |

Source: Office for National Statistics

Figure 4 highlights the contribution that each institutional sector made to annual growth in the net capital stock between 1998 and 2012. It shows that the strong rise in general government net capital stock growth partially offset slower net stock growth for households and NFCs, which accounted for a relatively higher share of the level over the entire period. It also shows a gradual slowdown in the contribution made from financial corporations over the entire period.

> Figure 4: Contributions to annual net stock growth by institutional sector chained volume measures, \%
> Reference year: 2010 Coverage: United Kingdom

[^1]
## 9 . Analysis by type of asset

Figure 5 shows that 'dwellings' accounted for the largest share of assets in 2012, at $£ 1.4$ trillion ( $41.2 \%$ of the total net capital stocks in 2012). 'Other buildings and structures' accounted for the second largest share at $37.8 \%$ ( $£ 1.3$ trillion in 2012), while 'other machinery and equipment', 'intangible fixed assets' and 'other assets' follow with $15.1 \%, 3.3 \%$ and $2.7 \%$ respectively.

Figure 5: Net capital stocks estimates by asset, 1997 and 2012, chained volume measures
Reference year: 2010 Coverage: United Kingdom

## Figure 5: Net capital stocks estimates by asset, 1997 and 2012, chained volume measures

Reference year: 2010 Coverage: United Kingdom

## Source: Office for National Statistics

Notes:

1. (a) Intangible fixed assets include software, entertainment and mineral exploration. (b) Other assets includes transport equipment and cultivated assets

Figure 5 and Table 3 show that net capital stocks of 'intangible fixed assets' were the only assets to decrease between 1997 and 2012, falling by $2 \%$ per annum on average over the entire period. The asset that experienced the strongest growth was 'other machinery and equipment', which increased by $50 \%$ over the entire period (or 2.7\% per annum), followed by 'other buildings and structures', which increased by 42\% since 1997 (2.4\% per annum).

Table 3 shows that the economic downturn affected the pace of net capital stock accumulation by varying amounts across assets. For example, 'other buildings and structures' rose at broadly similar rates across the predownturn (2.4\%), downturn (2.4\%), and post-downturn (2.5\%) periods. In contrast, 'other machinery and equipment' growth fell to $1.0 \%$ and $0.8 \%$ during the downturn and in subsequent years, compared with $3.7 \%$ average annual growth in the pre-downturn decade.

Table 3: Average annual growth in net capital stock by asset

Chained Volume Measures (CVM)

|  | $1998-$ <br> 2007 | $2008-$ <br> 2009 | $2010-$ <br> 2012 | $1998-$ |
| :--- | ---: | ---: | ---: | ---: |
| 2012 |  |  |  |  |
| Dwellings | $1.4 \%$ | $0.5 \%$ | $0.2 \%$ | $1.0 \%$ |
| Other buildings and structures | $2.4 \%$ | $2.4 \%$ | $2.5 \%$ | $2.4 \%$ |
| Other machinery and | $3.7 \%$ | $1.0 \%$ | $0.8 \%$ | $2.7 \%$ |
| equipment |  |  |  |  |
| Intangible fixed assets | $-2.0 \%$ | $-2.5 \%$ | $-1.8 \%$ | $-2.0 \%$ |
| Other assets | $1.6 \%$ | $-0.7 \%$ | $0.0 \%$ | $1.0 \%$ |
| Total net stock | $1.9 \%$ | $1.1 \%$ | $1.1 \%$ | $1.6 \%$ |

Source: Office for National Statistics

Figure 6 decomposes annual net capital stock growth between 1998 and 2012, according to the contribution made from the headline assets cited in Table 3. The largest growth in net capital stock between 1998 and 2012 was in 'other machinery and equipment' (2.7\%) and 'other buildings and structures' (2.4\%). This reflected relatively strong growth in both assets and the relatively large share of 'other buildings and structures'. 'Intangible fixed assets' showed a consistently negative contribution to growth. During the economic downturn, 'other buildings and structures' continued to make strong positive contributions to annual growth, while the contributions from 'other machinery and equipment' and 'dwellings' fell and have not increased since.

Reference year: 2010 Coverage: United Kingdom

## Figure 6: Contributions to annual net stock growth by asset chained volume measures, \%

Reference year: 2010 Coverage: United Kingdom

Source: Office for National Statistics

Asset and sector estimates for all measures of capital stock and capital consumption for CP and CVMs are available in the accompanying time series dataset and in the publication tables.

## 10. Analysis by industry

Estimates of capital stocks and the consumption of fixed capital can be analysed by industry using the UK Standard Industrial Classification 2007.

In these estimates there are four broad industry groupings; manufacturing, other production (agriculture, mining, electricity, gas, water and waste), construction and services. The share of the net capital stock held by the four broad industry groupings reflects the relative sizes of these groups in nominal Gross Value Added (GVA) terms. Table 4 shows that the services industries (sections G-T) held an estimated $£ 2,769$ trillion ( $79 \%$ ) of total net capital stocks at the end of 2012. Other production industries (sections A, B, D and E) held $£ 279$ billion ( $8 \%$ ); construction (section F) held $£ 248$ billion ( $7 \%$ ) and manufacturing (section C) held $£ 200$ billion ( $6 \%$ ). Since 1997, the percentage share of these industry groupings was relatively stable, although both the other production and service industries increased their percentage shares by $2 \%$ since 1997 , while the manufacturing and construction industries both reduced their percentage share by $2 \%$.

Table 4: The value in $£$ billion and percentage of net capital stocks held by broad industry groupings, 1997 and 2012

Notes:

1. (a) Other production includes agriculture, mining, electricity, gas, water and waste management

The types of fixed assets held as stock by the industrial sectors varied. For example, in 2012 service industries held the majority of their total net stocks either in 'dwellings' ( $£ 1,296$ billion or $47 \%$ ), or in 'other buildings and structures' (£985 billion or 36\%).

Other production industries also held the majority of their total capital stocks as 'other buildings and structures' (£172 billion or 62\%), however they also held a significant proportion of capital stocks as 'other machinery and equipment' ( $£ 87$ billion or $32 \%$ ).

The construction industry held the majority of their capital stocks in 'dwellings' ( $£ 144$ billion or $58 \%$ ) and 'other buildings and structures’ (£89 billion or 36\%).

In contrast, manufacturing industries held the majority of their capital stocks in 'other machinery and equipment' at ( $£ 116$ billion or $58 \%$ ) while 'other buildings and structures' accounted for a relatively small proportion ( $£ 75$ billion or 37\%).

Notes:

1. (a) Totals may not sum due to rounding
2. $z=$ data not applicable for this asset in this industry

As with the institutional sector and asset breakdowns, growth in net capital stock showed variation across the industries (Table 6). For example, the net capital stock held by manufacturing industries fell during the economic downturn, by $0.7 \%$ on average per annum in 2008 and 2009, before continuing to fall by $0.9 \%$ between 2010 and 2012. In contrast, growth in the net capital stock held by other production industries rose by $4.6 \%$ during the downturn, from $3.6 \%$ in the pre-downturn decade, and remained at this level in the most recent years.

Table 6: Average annual growth in net capital stock by industry
Chained Volume Measures (CVM)

| Net stock by industry <br> (CVM) | $1998-$ <br> 2007 | $2008-$ <br> 2009 | $2010-$ <br> 2012 | $1998-$ <br> 2012 |
| :--- | ---: | ---: | ---: | ---: |
| Manufacturing | $0.5 \%$ | $-0.7 \%$ | $-0.9 \%$ | $0.0 \%$ |
| Other production | $3.6 \%$ | $4.6 \%$ | $3.9 \%$ | $3.8 \%$ |
| Construction | $0.3 \%$ | $-0.8 \%$ | $-1.0 \%$ | $-0.1 \%$ |
| Services | $2.1 \%$ | $1.2 \%$ | $1.2 \%$ | $1.8 \%$ |
| Total net stock | $1.9 \%$ | $1.1 \%$ | $1.1 \%$ | $1.6 \%$ |

Source: Office for National Statistics

Reflecting the growth rates and the relative shares in Tables 5 and 6, Figure 8 shows that services industries consistently made the largest positive contribution to annual growth in the total net capital stock between 1998 and 2012. However, contributions from this industry fell during the economic downturn, while the contribution made from other production industries remained broadly stable.

Figure 8: Contributions to annual net capital stock growth by industry chained volume measures, \%

Reference year: 2010 Coverage: United Kingdom

> Figure 8: Contributions to annual net capital stock growth by industry chained volume measures, $\%$
> Reference year: 2010 coverage: United Kingdom

Source: Office for National Statistics

Estimates by industry for all measures are available in the accompanying time series dataset and in the publication tables.

## 11. Capital output ratio analysis

The capital output ratio is calculated by dividing capital stocks estimates by Gross Value Added (GVA), to obtain a measure of the capital intensity of each industry. GVA is the value of output less the value of intermediate consumption; it is a measure of the contribution to Gross Domestic Production (GDP) made by an individual producer, industry or sector. Intermediate consumption consists of the value of the goods and services consumed as inputs by the process of production, excluding fixed assets whose consumption are recorded as consumption of fixed capital; the goods or services may be either transformed or used up by the production process.

The capital output ratio shows the ratio of capital stocks to output. It has been calculated for gross and net capital stocks measures in the publication tables back to 1997.

All else being equal, if there is a higher level of capital stock in the economy; workers should theoretically be able to produce a greater quantity or quality of output using the same quantity of labour input. Thus, higher level of productivity arises because workers have more, or better tools or facilities at their disposal.

Figure 9 shows that using this measure, the most 'capital intensive' industry in 2012 was the real estate industry, which held the vast majority of its assets in dwellings. Manufacturing, construction and utilities industries also showed relatively high levels of 'capital intensity' (of which a smaller proportion of this can be attributed to dwellings). In contrast, other professional and government services industries showed smaller rates of capital intensity.

Figure 9: Capital intensity by industry sector

Net stocks in 2012 divided by Gross Value Added (GVA) in 2012

Industries have different levels of capital output ratios over time, as shown in Figure 10, which indexes the aforementioned ratios to $2010=100$. An increase in a line shows that the capital output ratio has increased. Construction and manufacturing rose sharply in their intensity in 2008; this was because the level of GVA fell during this period while the capital stock continued to grow.

Figure 10: Net capital stocks to output ratio, chained volume measures
ratio of net stock (NS): Gross Value Added (GVA)
Figure 10: Net capital stocks to output ratio, chained volume measures

Notes:

1. Index $2010=100$

Capital output ratio estimates by industry for all measures are available in the accompanying time series dataset and in publication tables.

## 12. Net capital stocks per employed person

In this release, ONS have also published data for the level of capital stock per employed person. Net capital stocks are used in this calculation because they provide a better estimate of the value of capital stocks at a point in time than gross stocks. Data on employment includes both employees and the self-employed by industry sector, sourced from table EMP14 (262.5 Kb Excel sheet) of the ONS Labour Market Statistics, May 2014.

Figure 11 shows the annual growth in capital stock per employee from 1998 to 2012. Between 2008 and 2009 there were sharp rises, reflecting a sharp fall in employees, which more than offset slower capital stock growth during this period. In the most recent years, this ratio rose at a slower rate and even fell in 2012. This suggested that firms were diverting resources away from capital and more into labour inputs. This is explored further in the July 2014 Economic Review published alongside this bulletin.

Figure 11: Year on year growth in net capital stock per employed person
\% change in capital per employed person

## Figure 11: Year on year growth in net capital stock per employed person

$\%$ change in capital per employed person

Source: Office for National Statistics

Capital stocks per employed person estimates by industry for gross and net stocks are available in the accompanying time series dataset and in publication tables.

## 13. International comparisons

Broadly speaking, net capital stock has moved in line with the UK's major counterparts, in terms of both annual growth and capital output shares. This can be seen in figure 12, which plots the UK year on year net capital stock growth rate compared with other members of the G7 ${ }^{1}$. The UK has among the highest rates of net capital stock growth across the G7, and is broadly comparable to France. Figure 12 also shows that growth in the net capital stock fell noticeably across all G7 economies during the economic downturn, recovering somewhat in 2010 and 2011 before falling again in 2012 (estimates for 2012 are not currently available for all countries). The latter could have been attributed to renewed economic uncertainty in the euro area.

Figure 12: Year on year net stock growth rate of G7 economies in their own currencies
Percent

## Figure 12: Year on year net stock growth rate of G7 economies in their own currencies

## Source: Office for National Statistics

## Notes:

1. Data was not available for all countries in 2012 at the time of this publication

Figure 13 presents the Capital Output Ratio compared with the same major economies. It shows that the UK had the second lowest capital output ratio at around $2.5 \%$. This is broadly in line with relevant GFCF estimates; the UK has historically invested a smaller proportion of its GDP compared with the G7 (17\% in the UK compared with $21 \%$ in both the G7 and the euro area between 1997 and 2012 respectively ${ }^{2}$ ). Figure 13 also shows the ratio gradually rising during the pre-downturn decade, before rising a little more strongly in 2009, when the level of net stock continued to grow while the level of GVA fell.

Figure 13: Capital Output Ratio in their Own Currencies

## Notes:

1. Data are not available for Germany for years 1998-2000, US for 1997. Italy, US, and Germany data are not available for 2012

## Notes for international comparisons

1. The G7 is a group of seven countries with advanced economies: Canada, France, Germany, Italy, Japan, United Kingdom (UK) and United States (US). All data used are taken from the Organisation for Economic Co-Operation and Development (OECD) or the country's respective national statistics institute
2. Source: World Bank

## 14. Background notes

## 1. Important information for users

These estimates are not consistent with the 2013 United Kingdom National Accounts (Blue Book). These estimates have been produced using Blue Book 2013 GFCF methods (see Explaining UK Investment Estimates: past, present \& future) plus reconverted GFCF source data, for all years, from SIC 2003 to SIC 2007; the data do not includes European System of Accounts (ESA) 2010 changes. Consistency will be restored with the next publication of this release (scheduled for November 2014) which will be consistent with the estimates used in Blue Book 2014 (including ESA10 changes).

The series in this release cover the period 1997 to 2012. Estimates for 2013 will be published in the next release in November 2014. Estimates for periods before 1997 are not yet available. ONS will be working to re-instate these estimates and provide users with a longer time series. An update on progress on pre-1997 estimates will be included in the November 2014 publication.

## 2. Revisions

There are revisions to the estimates for 1997 to 2009, this is not in line with the National Accounts revisions policy. This is the result of the introduction of new methods and more up-to-date GFCF estimates being available since the last publication in 2010. This publication will rejoin the usual National Accounts Revision Policy for Blue Book 2014.

A full explanation of the National Accounts revisions policy is available on the ONS website ( 43.3 Kb Pdf).

## 3. Use of the data

Capital stocks and the consumption of fixed capital estimates are produced annually and used internally by ONS in the UK National and Economic Accounts and Public Sector Finances. They are also used externally by the Bank of England, the Office for Budgetary Responsibility, Her Majesty's Treasury, the Statistical Office of the European Communities (EUROSTAT), business and research communities, educational communities, the media and the general public. These estimates are used to monitor economic performance and inform monetary and fiscal policy decisions, as well as for international comparisons.

The consumption of fixed capital is used in various ways in the National Accounts, in particular:
a) For all sectors, consumption of fixed capital is used to convert the gross-based estimates, such as gross domestic product or gross operating surplus, into the net estimates such as net national income.
b) For the non-market sectors (central and local government, and non-profit institutions serving households) consumption of fixed capital forms part of the sectors' contributions to the economy as measured using gross value added, and is the only component of gross operating surplus for these sectors, leaving the net operating surplus as zero.

Additionally, capital stocks and capital consumption estimates are also used in the calculation of quarterly profitability estimates of UK companies.

## 4. Methods

The aims of the Quality and Methodology Information (QMI) report are to provide users with a greater understanding of ONS' statistics, their quality and the methods that are used to create them. A Quality and Methodology Information ( 88.9 Kb Pdf) report for this publication can be found on the ONS website; however the methods used to compile these estimates have changed significantly since it was last updated. This bulletin and the articles that accompany it, provide an updated description of the methods and sources. ONS aims to update the QMI report ahead of the next publication in November 2014.

Estimates of capital stocks and consumption of fixed capital are now produced using a new methodology, as explained in the methodological changes to the estimation of capital stocks and consumption of fixed capital and impact of the methodological changes to the estimation of capital stocks and consumption of fixed capital articles published in June and July 2014.

Estimates of capital stocks are calculated using the Perpetual Inventory Method (PIM).

## Data sources

The input data for the PIM system are provided at a low level of aggregation with industries classified using the 2007 version of the Standard Industrial Classification (SIC2007). The main input data sets entering the PIM model are given below.

## i) GFCF (investment) data

The PIM uses a long run constant price time series of GFCF estimates (investment in capital assets) classified by SIC2007 industries. The series extend as far back as the nineteenth century for some longlived assets such as buildings and dwellings. The PIM system uses constant price investment data based at 2010 prices.

Estimates of GFCF and its breakdowns by sector and asset (from 1997) are published separately in the quarterly Business Investment Statistical Release.

## ii) Price indices (deflators)

The capital stocks system uses, from 1997 onwards, the same deflators used to deflate GFCF; prior to 1997 consistent deflators are used. The GFCF asset deflators are constructed from product based Producer Price Indices (PPIs), Services Producer Price Indices (SPPIs), construction price indices and some Gross Domestic Product (GDP) implied deflators. The product-based deflators are weighted to assets using estimates from ONS' annual Business Spending on Capital Items Survey (BCIS). BCIS collects detailed data on GFCF by product, which informs the weight of each product in each asset. A list of the deflators used for each asset, and their source, is given in Table 6. The same deflator is used for each asset, regardless of the industry it is in. ONS is planning a full review of the GFCF deflators, as part of the national accounts programme of continuous improvement.
iii) Life lengths and premature scrapping

Each asset is assumed to have a life length during which it is economically productive. This will differ between assets with buildings typically having a longer life length than computer software for example.

Bankruptcy series are used in the PIM to model firm closures, and it is assumed that half the plant assets of insolvent firms are prematurely scrapped. Bankruptcy data are provided to the ONS by the UK's Insolvency Service on an annual basis.

## iv) Other data

Retirements of assets are assumed to be normally distributed around the mean asset life length. That is, not all of the stocks of an asset which lasts five years, for example, are assumed to leave the PIM after five years - rather, the retirements are spread around this date. To model this, the parameters for the distribution of asset retirements are entered into the PIM. This is called the coefficient of variation for each asset.

## Understanding the data: Perpetual Inventory Method (PIM)

A PIM is an economic model that enables balance sheets (or stocks) to be calculated from the associated flows. In this case, the PIM uses GFCF estimates to model the value of capital stocks in use in the UK. Assumptions about the life of these capital stocks are used to ensure that they are withdrawn from the
model when they are no longer economically useful.
For estimates of consumption of fixed capital and net capital stocks, assets are written down (i.e. decrease in value) over their lifetime. For gross capital stocks, the asset is valued at its new replacement cost until it is retired.

In the ONS PIM straight line depreciation is assumed. This is a depreciation profile based on a constant rate for the consumption of fixed capital over the service life of the asset. This service life is the total period during which the asset remains in use or ready to be used, in a productive process, even if the asset has more than one owner.

The main measures produced by the PIM are gross capital stocks, net capital stocks and consumption of fixed capital by asset, industry and sector. The PIM calculates all the series at constant prices and then uses appropriate price indices to produce (reflate) current price estimates.

The PIM uses GFCF at constant prices for low-level assets and industries across the whole economy. It calculates the capital stocks and consumption of fixed capital series at constant prices at this level. It then applies proportions to sectorise these across the economy based on the historic pattern of capital stocks across sectors of the economy. These series are then reflated using deflators to give current price estimates.

Further information on PIM model can be found in the following articles: UK capital stocks developments in coverage and methodology ( 446.3 Kb Pdf ) Improving non financial balance sheets and capital stocks (609.9 Kb Pdf)

## International reporting standards

The International Financial Reporting Standards (IFRS) were introduced from 2005 onwards in the UK. IFRS is the legally-required financial reporting framework for the consolidated accounts of EU listed groups of companies. IFRS differs in some respects from the UK financial reporting standards.

The impact on the capital stocks and consumption of fixed capital estimates is difficult to assess as the impact of the transition to IFRS varies by company. Work by ONS provided little evidence that material differences would occur as a result of the transition. Furthermore, the Quarterly Capital Expenditure Survey, which is the source for around $50 \%$ of GFCF estimates, asks respondents to record their investment data without any allowance for depreciation. On this basis, the transition to IFRS should not prevent time series analysis of the capital stocks and consumption of fixed capital dataset.

## Further information on methodology

Users will notice a large change in estimates of 'other machinery and equipment', in non-financial corporations (S.11) and central government (S.13) in 2005. This is due to the reclassification of British Nuclear Fuels Limited (BNFL) in April 2005. As part of this classification change, nuclear reactors were transferred from British Nuclear Fuels Limited (BNFL) (414.3 Kb Pdf) to the Nuclear Decommissioning Authority (NDA). BNFL is classified as a public corporation in National Accounts and the NDA as a central government body. The estimates in this release reflect this transfer from the public corporations sector. The value of the transfer was $-£ 15.6$ billion. The negative value reflects the fact that the reactors are at the end of their productive lives and have large decommissioning and clean-up liabilities.

## International comparisons

The UK aims to produce the capital stocks and consumption of fixed capital estimates to correspond with international standards, namely the System of National Accounts (SNA) and the European System of Accounts (ESA). The PIM model used to calculate capital stocks and consumption of fixed capital is utilised across the world and is in line with international guidance. The way in which the PIM model and its assumptions are implemented will differ between countries. This will reflect the differing circumstances in different countries. This means that users can compare estimates between countries but should be aware that differences in methods may contribute to differences in estimates.

Both Eurostat and the OECD hold internationally comparable estimates for capital stocks and the consumption of fixed capital. When comparing between countries, users should ensure that they are comparing figures in the same currency and that there are no definitional differences noted.

Eurostat currently have a reservation in place concerning the average life length of roads in the UK. The UK PIM model uses an average life length of 75 years, whereas European guidance states that it should be in the range of 50 to 60 years. By reducing the average life length of roads this asset will live for a shorter period. Therefore the consumption of fixed capital for this asset will increase. Reservations are
used to bring greater consistency and compliance with regulations across member states. ONS is working to lift the reservation.

## Comparisons with Other data sources

## National Balance Sheet (NBS)

There are links between the net capital stocks estimates and the estimates shown for AN. 111 Fixed assets in the non-financial section of the NBS. In the NBS, estimates are taken directly from the current price net capital stocks dataset for assets 'machinery and equipment' and 'intangible fixed assets' for all sectors except central and local government.

For all other assets, data are calculated based on a wide range of data sources about asset values in the economy. For this reason, these two data sources will show differing values. The biggest difference is the valuation of dwellings. The capital stocks data uses investment data over time in the dwellings only and not the land. The NBS is calculated using property market data and also includes the value of land. As a result, the valuation of fixed assets in the NBS are higher than in the net capital stocks dataset.

## Capital services

Capital services are the flow of services into the production of output that are generated by the capital stock, as opposed to the stock of capital itself. Capital services are a measure of capital input that is more suitable for analysing and modelling productivity.

The fundamental difference between capital stocks and capital services is that whereas capital stocks are a wealth-based measure of the total amount of capital within the economy, capital services are a measure of the flow of services derived from net stock. Capital services weight together the different assets by their relative productivity, measured by a derived rent function. The rent function, otherwise known as the user cost, is essentially how much the user is willing to pay to use the asset. As a user is willing to pay up to what an asset will give back, the rent function can be seen as measuring the difference in the additional returns between assets. The rent function is important because assets such as computers and software have become cheaper over the last decade, meaning a wealth measure like capital stocks does not truly reflect the return to those assets.

The ONS has not published a paper on the stand-alone capital service also known as VICS (Volume Indices of Capital Services) since Appleton \& Wallis 2011. However capital service estimates have been produced for Multi Factor Productivity (MFP) the latest paper being Field \& Franklin 2014. However users should note that these estimates are highly experimental.

## 5. Quality assurance

These statistics were withdrawn from publication in 2011 after standard ONS quality assurance checks raised issues with the quality of the data. As explained in a progress update published on 17 January 2013, ONS identified two main issues which prevented publication:

- the transition from the Standard Industrial Classification 2003 (SIC2003) to the Standard Industrial Classification 2007 (SIC2007)

The detailed breakdown of industries on a SIC2007 basis varies greatly from the previous SIC2003. There was a series break in 1997 (the first year of national accounts central system processing) which also led to processing issues. This was due to post-1997 data having already been collected on/converted to a SIC2007 basis and pre-1997 data being on a SIC2003 basis.

To address these concerns, the estimates in this statistical bulletin and all associated outputs have been extensively quality assured in line with the Code of Practice for Official Statistics.

## What quality assurance has taken place?

Quality assurance checks have included detailed analysis at all levels of the data, to guarantee integrity and consistency. This has included a complete review of the capital stocks system in order to ensure that everything is performing as expected.

In terms of detail, the process has involved analysing all data being entered in to the system, and every process involved in the calculation of capital stocks estimates to ensure that the outputs are correct according to our specified methodology.

The quality assurance process has also included economic analysis of the estimates, to confirm that the data are changing in a plausible manner, and that expected changes over time (for example, the recent economic downturn) can be seen and explained.

To summarise, the quality assurance process has included:

- thorough dataset analysis, ensuring that the data are correct at the lowest level of detail
- a review of the deflators used within the capital stocks system, to maintain consistency with other deflators and to keep in line with National Accounts methodology
- a complete system review, to ensure integrity and consistency throughout the process
- economic analysis, to review what the data are showing at a macroeconomic level and to see how the proposed estimates compare with existing economic figures
- publication analysis - detailed checking of all published articles and tables for accuracy and to better tailor the material to serve the citizen user

## Who carried out the quality assurance?

This extensive Quality Assurance process has been carried out by:

- the ONS capital stocks and Gross Fixed Capital Formation (GFCF) team
- ONS economists from the Office of the Chief Economic Advisor (OCEA)
- aspects of the methodology have been reviewed by ONS methodologists

## 6. What do you think?

We are striving to improve this release and its associated commentary. We would welcome any feedback you may have, and would be particularly interested in knowing how you make use of these data to inform your work. Please contact us via email: gcf@ons.gov.uk or telephone Wesley Harris on +44 (0)1633 4545250.

There is a Business and Trade Statistics community on the StatsUserNet website. StatsUserNet is the Royal Statistical Society's interactive site for users of official statistics. The community objectives are to promote dialogue between users and producers of official business and trade statistics about the structure, content and performance of businesses within the UK. Anyone can join the discussions by registering via either of the links above.

## 7. National statistics

The United Kingdom Statistics Authority has designated these statistics as National Statistics, in accordance with the Statistics and Registration Service Act 2007 and signifying compliance with the Code of Practice for Official Statistics. Designation can be broadly interpreted to mean that the statistics:

- meet identified user needs
- are well explained and readily accessible
- are produced according to sound methods
- are managed impartially and objectively in the public interest

Once statistics have been designated as National Statistics it is a statutory requirement that the Code of Practice shall continue to be observed.

## 8. Social media

Follow ONS on Twitter and receive up to date information about our statistics. Like ONS on Facebook to receive our updates in your newsfeed and to post comments on our page.

## 9. Government Statistical Service (GSS) business statistics

To find out about other official business statistics, and choose the right data for your needs, use the GSS Business Statistics Interactive User Guide. By selecting your topics of interest, the tool will pinpoint publications that should be of interest to you, and provide you with links to more detailed information and the relevant statistical releases. It also offers guidance on which statistics are appropriate for different uses.

## 10. Special events

ONS has published commentary, analysis and policy on 'Special Events' which may affect statistical outputs. For full details visit the Special Events page on the ONS website.

## 11. Release Policy

All data in this release can be downloaded free of charge from the ONS website. Here are the instructions to obtain a full time series of data from the statistical bulletin or release pages:

Select 'Data in this release' Select 'View datasets associated with this release' Select the latest release Select 'Select series from this dataset' Select the reference table of interest Select 'View series' Select the series of interest (Hint: for a custom download you can use SHIFT to select a range of series or CTRL to select multiple individual series) Select 'View selection' Select 'Download'.
12. Details of the policy governing the release of new data are available by visiting www.statisticsauthority.gov. uk/assessment/code-of-practice/index.html or from the Media Relations Office email: media.relations@ons. gsi.gov.uk

## 14th November 2014 - Correction

Please note, as of 14th November 2014, Table 2.5.2 previously published on 2nd July 2014 has been amended. This error affects total 'other production' (MRIJ) and 'manufacturing' (MQX7). capital stocks to output ratios.

## Important Information for Users

This is the first publication of capital stock estimates since 2010. Estimates of capital stocks and consumption of fixed cap ital are now produced using a new methodology, as explained in the 'methodological changes to the estimation of capital stocks and consumption of fixed capital' and 'impact of the methodological changes to the estimation of capital stocks and consumption of fixed capital' articles published in June and July 2014. Users are advised to read these articles and the background notes of this release

Key changes to the 2013 publication tables are:
A change to the Standard Industrial Classification (SIC) - this has been updated from SIC2003 to SIC2007, and has an impact on the industry breakdowns;
'Cultivated' assets have been included in these estimates for the first time;

A detailed breakdown of 'Intangible' assets has been provided in the publication tables.
It has not been possible to provide an asset breakdown of the institutional sector non-financial corporations (S.11), into public corporations (S.11001) and private non-financial corporations (S.11PR). ONS will aim to resolve this issue in time for the publication of Blue Book 2016.

ONS has been unable to fully implement the new methodology produce estimates for the central and local government sectors

ONS has been unable to fully implement the new methodology to produce estimates for the non-profit institutions serving households (NPISH) sector. NPISH includes for example charities and trade unions. This means that the changes described in the article published on 25 June 2014 have been implemented. However the NPISH data from the PIM model were fixed at an early stage of the timetable and are not consistent with the outputs for other non -government sectors. ONS plan to remove this inconsistency as National Accounts revision policy allows.

All data within these tables are available to download for periods 1997 to 2012 from the time series dataset.

## Capital Stocks and Capital Consumption

TOTAL Total 4.4
${ }^{1}$ Capital stock to output ratio has been calculated by dividing gross capital stocks by Gross Value Added estimates published in the
Second Estimate of GDP, 22 May 2014.
${ }^{2}$ n.e.c. represents; not elsewhere classified.
Note: Differences between totals and sums of components are due to rounding
$z$ denotes where data is not collected, not present or unavailable for an industry or asset.

Ratio of net capital stock to employment has been calculated by dividing net capital stocks by all 'employees by industry
sector' table EMP14, Labour Market Statistics 14 May 2014.
${ }^{2}$ n.e.c. represents; not elsewhere classified.
Note: Differences between totals and sums of components are due to rounding
denotes where data is not collected. not present or unavailable for an industry or asset

${ }^{1}$ Capital stock to output ratio has been calculated by dividing consumption of fixed capital by Gross Value Added estimates published
in the Second Estimate of GDP, 22 May 2014.
represents; not elsewhere classified
Note: Differences between totals and sums of components are due to rounding
Note: Differences between totals and sums of components are due to rounding
$z$ denotes where data is not collected, not present or unavailable for an industry or asset.
3.5.2 Consumplion of fixeed Capiatat o output Raitio by yndustry at Chained Voume Measures
