Next release: 18 May 2016

Table of contents

- 1. Introduction
- 2. <u>Real AWE</u>
- 3. Contributions to nominal AWE single month

1. Introduction

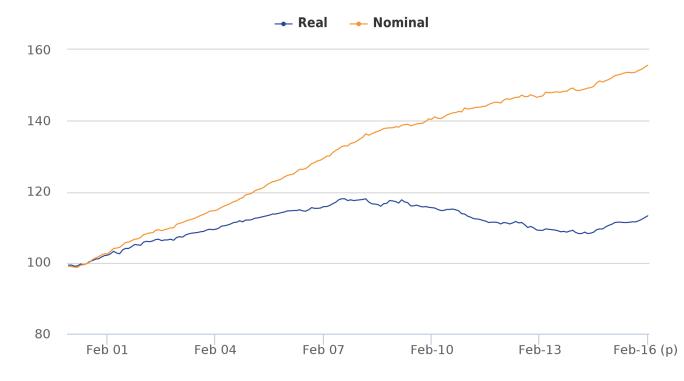

This note presents 2 analyses of the Average Weekly Earnings (AWE) figures, which are published in the <u>UK</u> <u>Labour Market Statistical Bulletin</u>. We will update these analyses every month. The first section describes real AWE, which is AWE deflated by the Consumer Price Index. The second section analyses single month movements in the nominal AWE.

2. Real AWE

The charts below show the recent movements in real AWE (whole economy). This is calculated as nominal unadjusted AWE, divided by the Consumer Price Index (CPI). This series is calculated for regular and total pay at the whole economy level and then seasonally adjusted. The data in Figures 1 and 2 are levels of real and nominal AWE, shown on a monthly basis, with an index of 2000 = 100. Figure 3 shows 3 months on 3 months previous year increases in these derived indices. The data are available in <u>dataset EARN01</u>, together with estimates of real AWE at 2000 prices.

Comparing the 3 months to February 2016 with the same period in 2015, real AWE (total pay) grew by 1.6%, compared with 2.0% in the 3 months to January. Nominal AWE (total pay) grew by 1.8% in the 3 months to February, while the CPI increased by 0.3% in the year to February 2016. Over the same period, real AWE (regular pay) grew by 2.0%, the same growth as seen in the 3 months to January. The nominal AWE (regular pay) rose by 2.2% in the 3 months to February.

Great Britain, January to March 2001 to December to February 2016 (3 month average time periods)

3. Contributions to nominal AWE – single month

The wages and employment contributions underlying the latest AWE data are available on our website in the <u>EARN02 dataset</u> each month. The 'employment contribution', shown in these charts, changes if the relative proportion of employment in the 24 industrial headings changes, but will not necessarily change if total employment increases. Employment contributions were significantly negative in 2009 and 2010, largely caused by a shift away from employment in Financial and Insurance Activities, which are relatively highly paid industries.

Figures 4 and 5 summarise the recent figures:
