

2021 Census Cohort Study

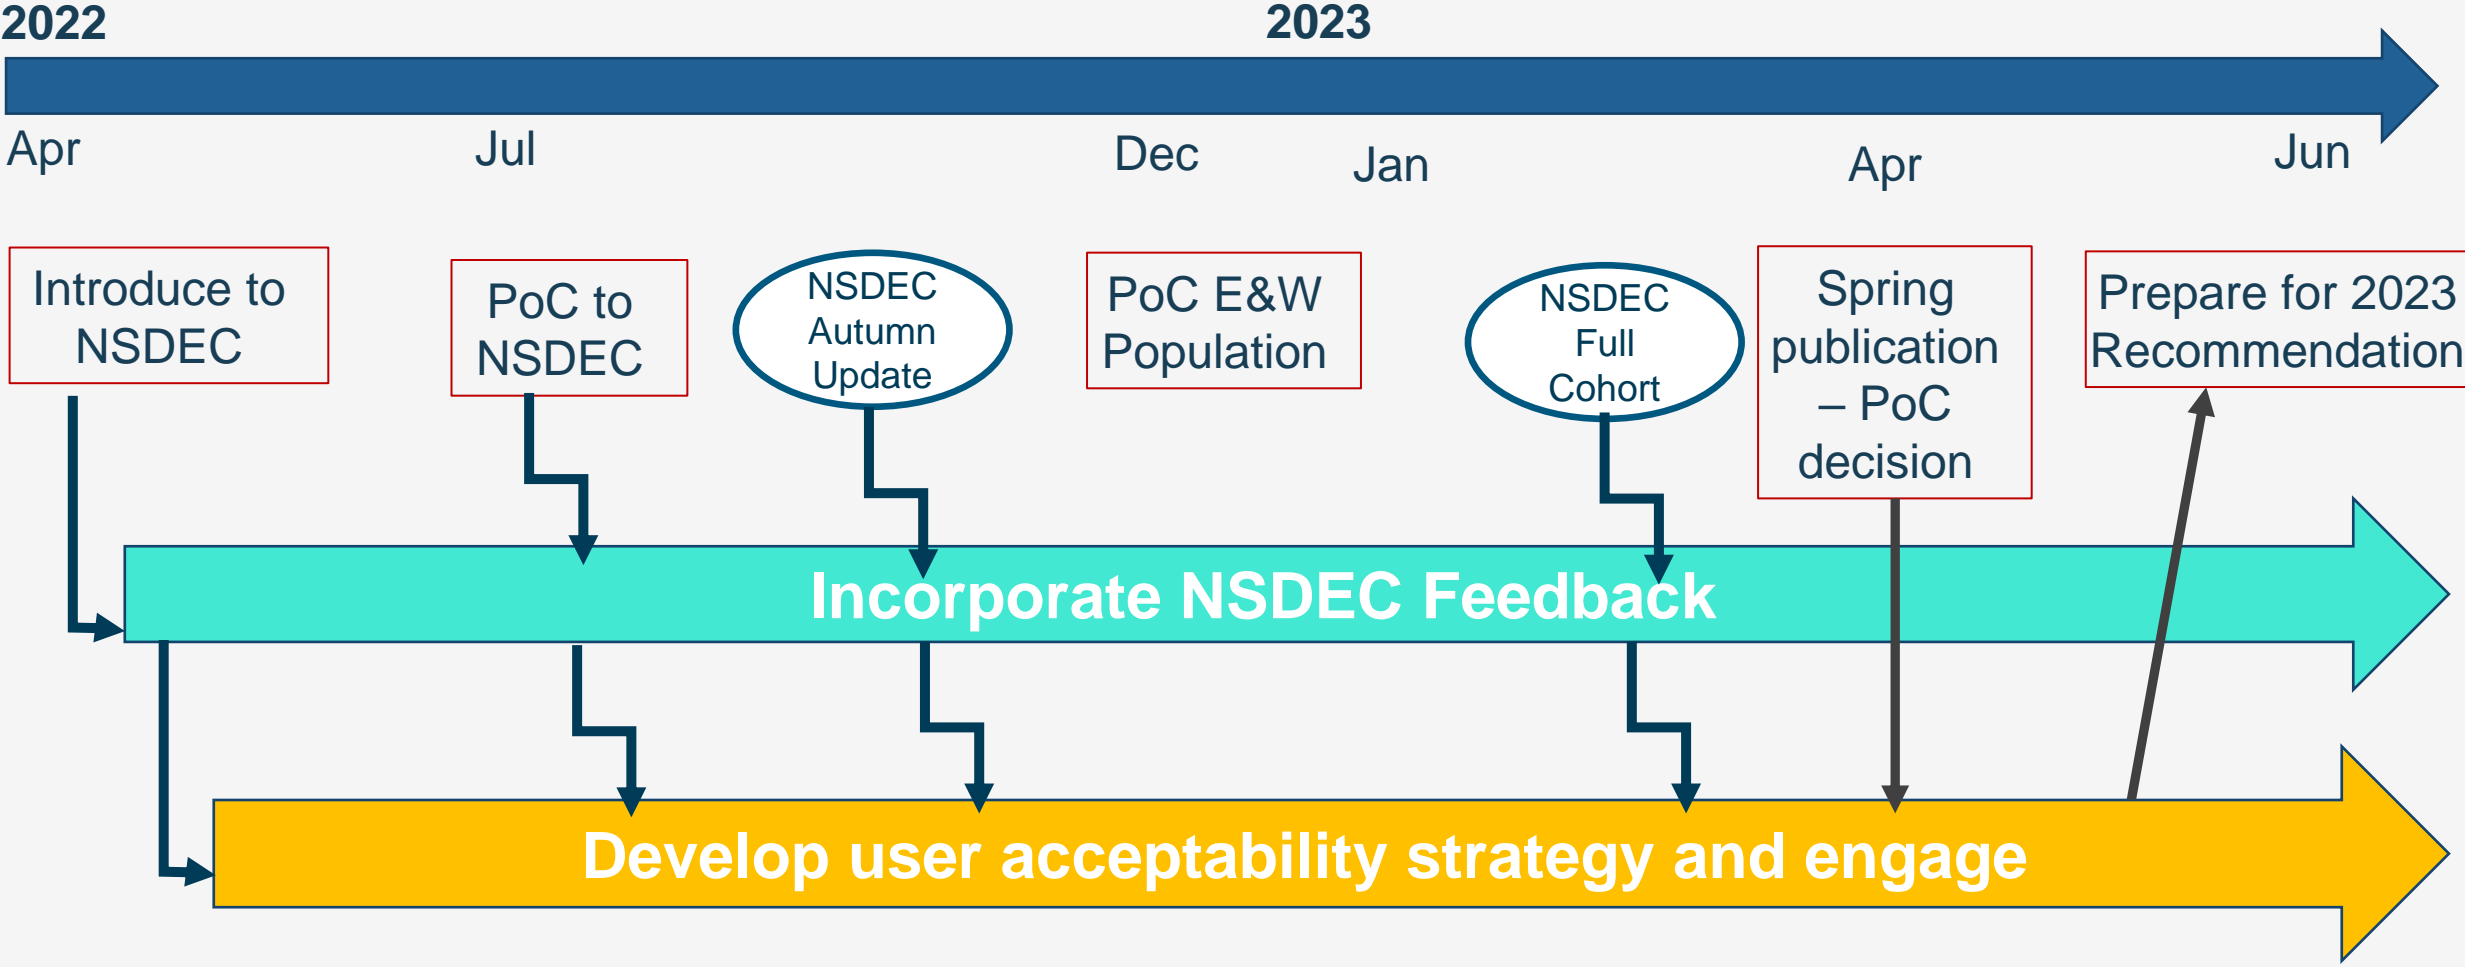

Louisa Blackwell & Nicky Rogers
Presentation to NSDEC 27 April 2022

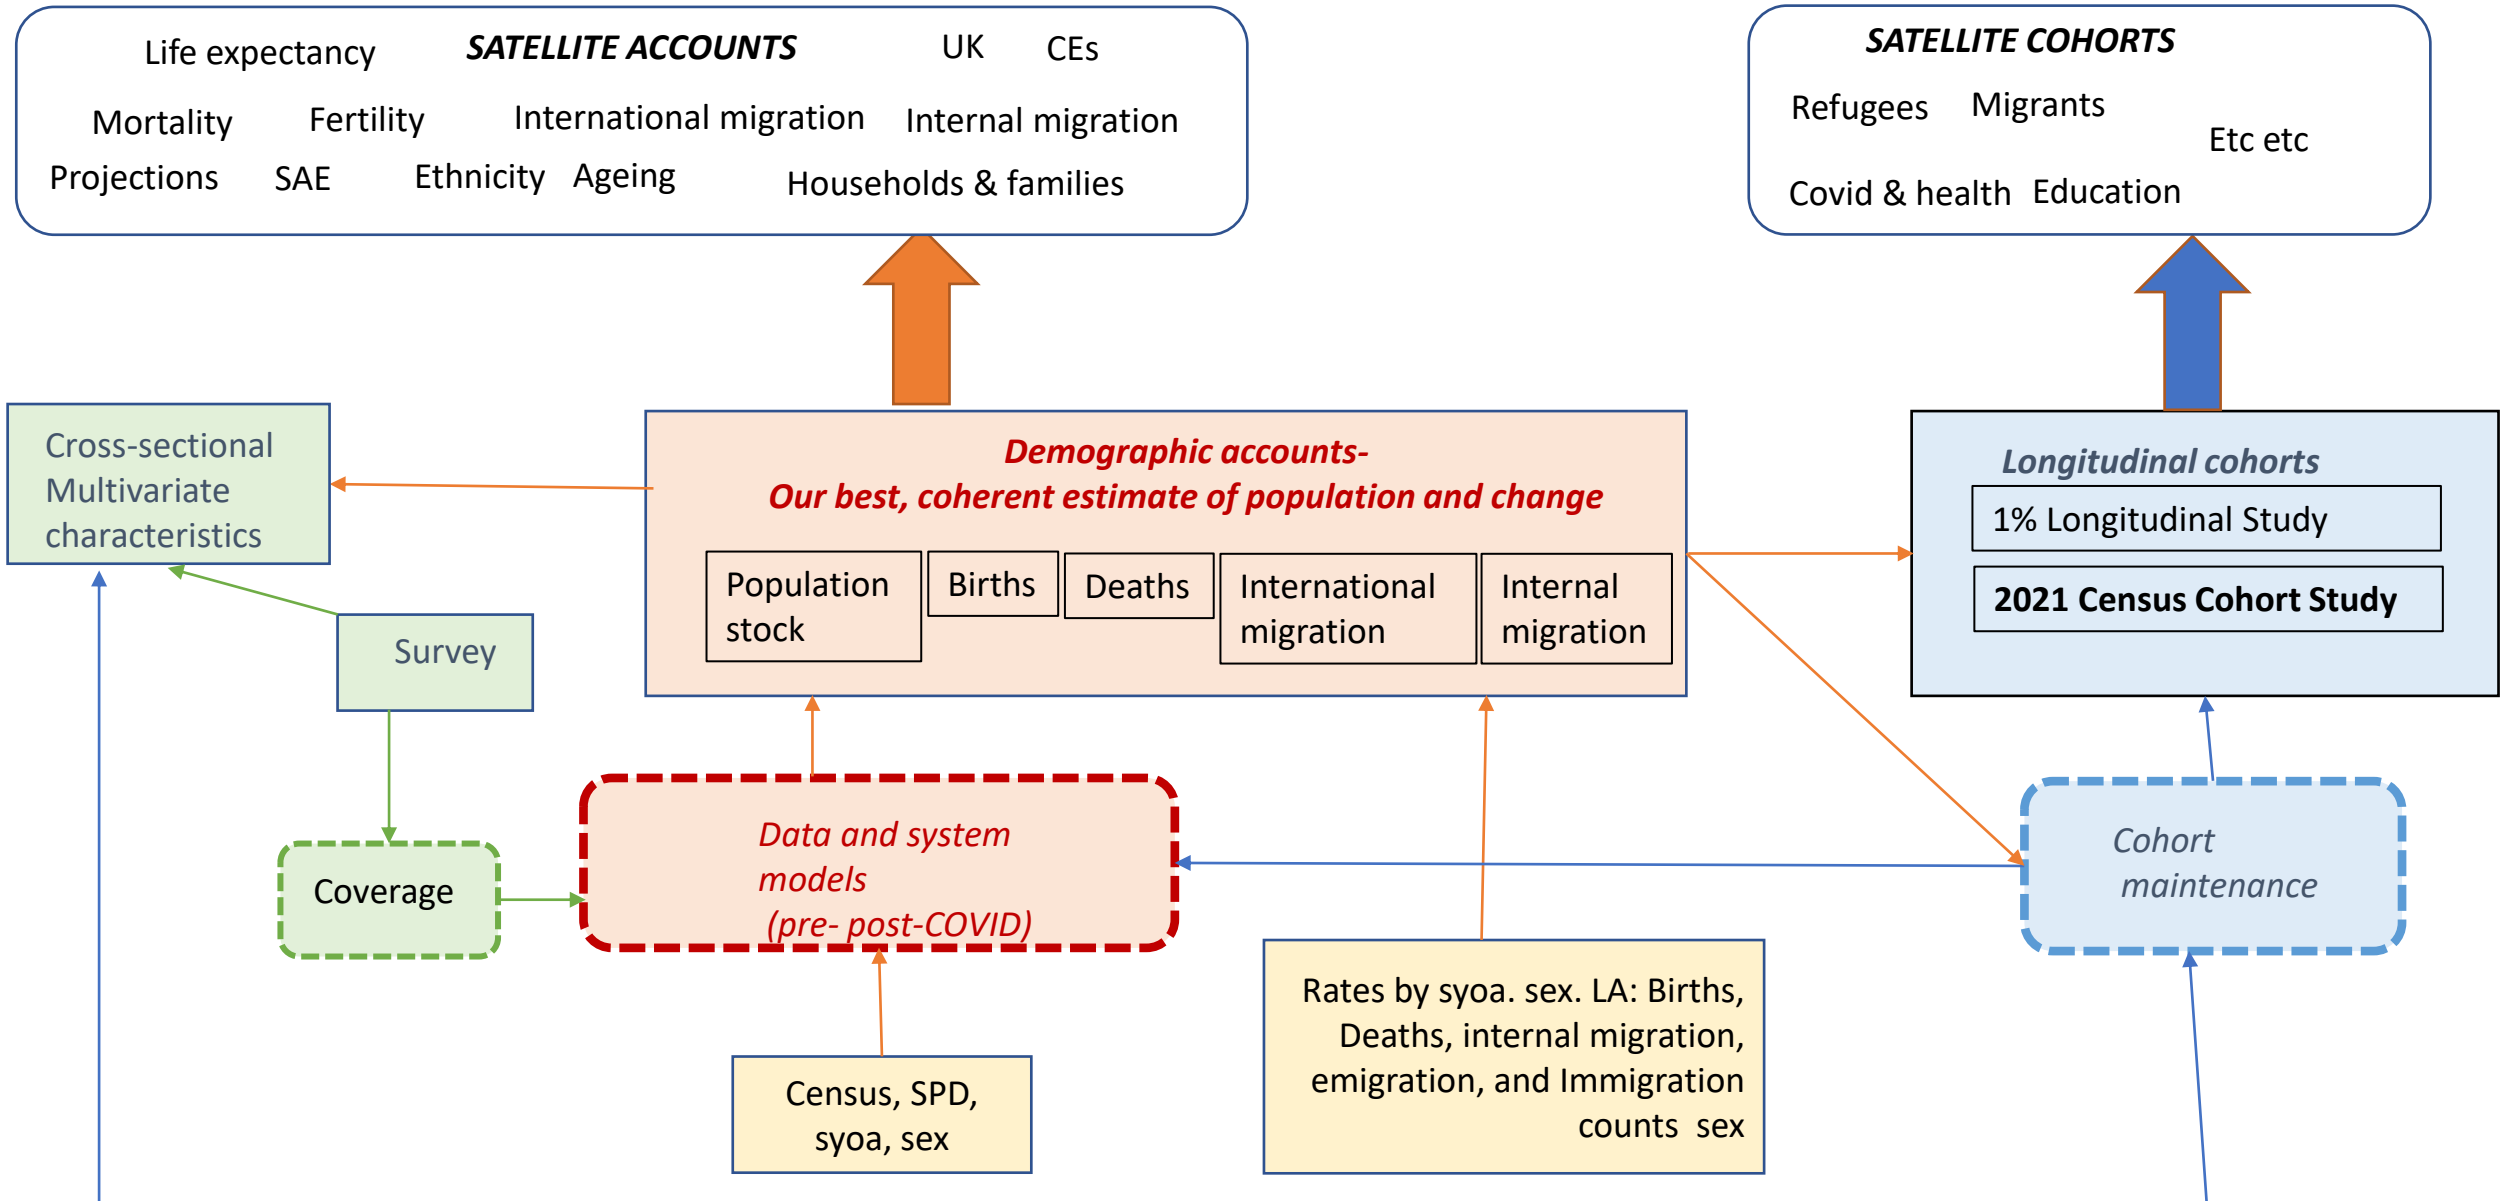

Outline

- Overview and Timeline
- Context and rationale for 2021 Census Cohort Study
- Proof of Concept
- Ethical principles
- Feedback and guidance

Overview and Timeline

Hybrid Statistics System

Coherence and benchmarking: the virtuous statistical triangle

Behaviour through time

- Demographic trends and behaviours
- Data and system models

- Need all three to provide robust solution to population estimation
- Benchmarking happens between these statistical products

Longitudinal microdata

- Census, admin and survey-based prospective admin data linkage

Dynamic Population Model (DPM) – coherence

Cross-sectional microdata

- Statistical Population Dataset (SPD)
- Survey data

2021 Census Cohort: Rolled forward population

Aim: To give the best ‘microdata’ representation of the E&W population over time.

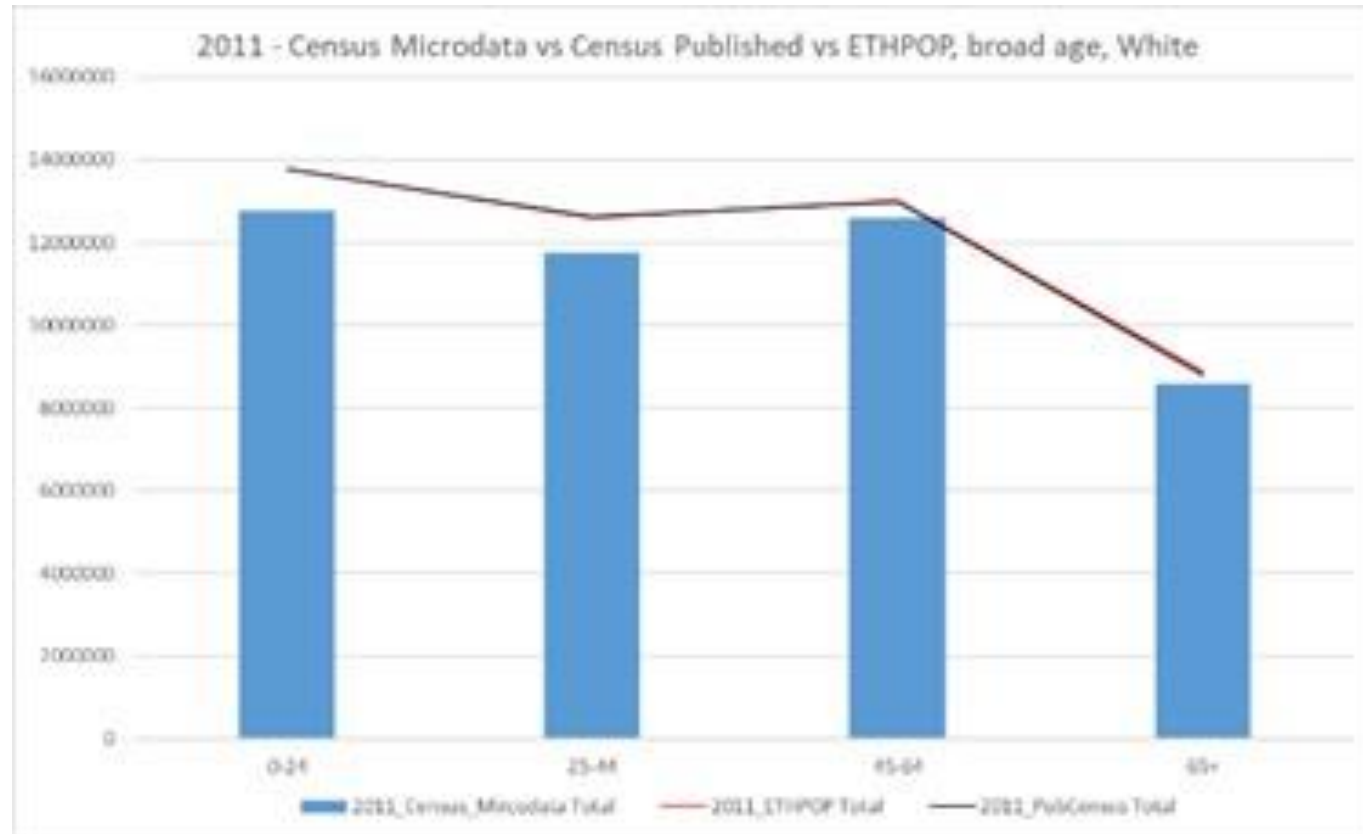

Objectives:

- **Statistically controlled dataset – feedback loop with DPM (signals + weights) that acts as a benchmark study**
- Use 2021 Census as a starting base – good coverage and high response
- Allow cohort replenishment through inclusion of births and immigrations + flagged deaths and emigrations
- Report more granular analyses than is possible with 1% LS
- Only high quality admin data used to create new records for immigrants
- Ensure data inclusivity of marginal or ‘invisible’ population groups e.g. refugees, NEETS

Focus on design principles: cohort maintenance

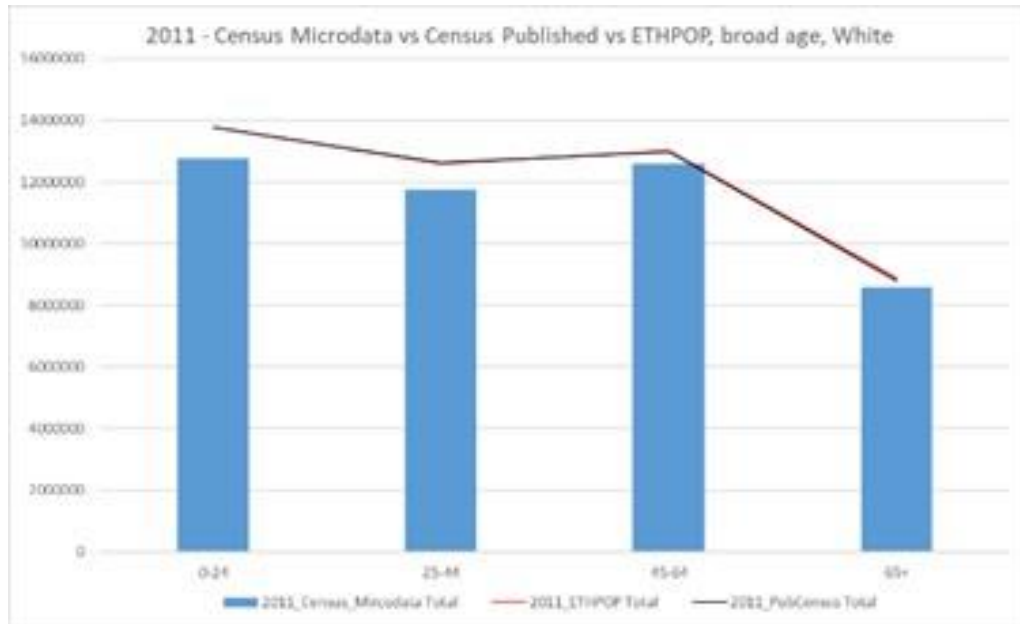

1. **Why?** Importance of cohort maintenance
2. **What? When?** Maintaining the representativeness of the 2021 Census Cohort
3. **How?** Capturing migration

Non-replenished cohort by broad age; White

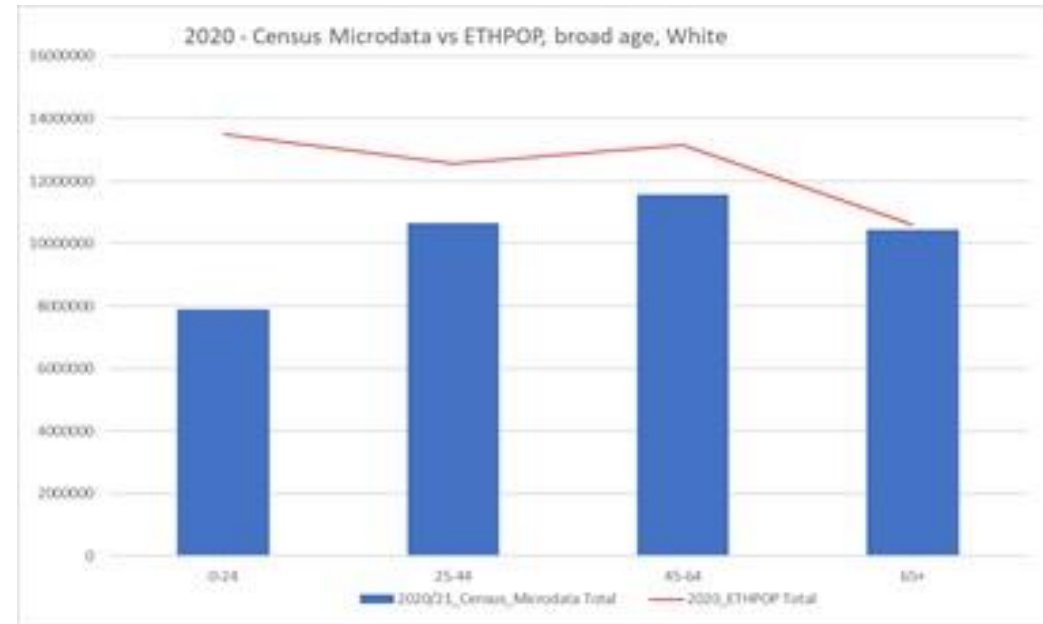

2011

Non-replenished cohort by broad age; White

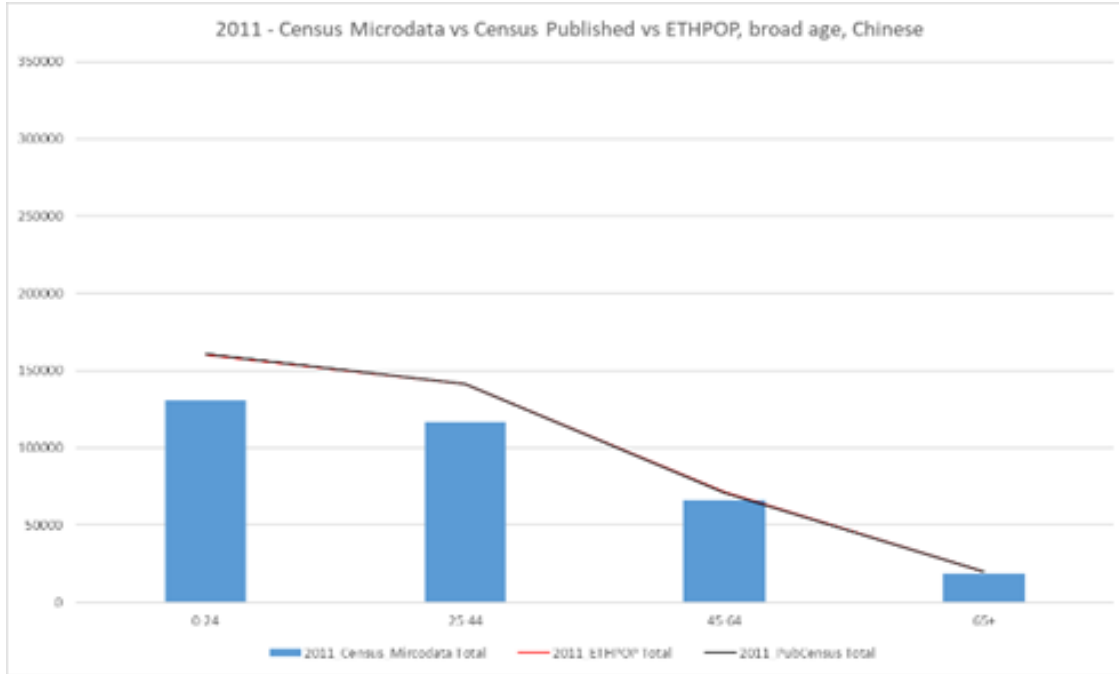

2011

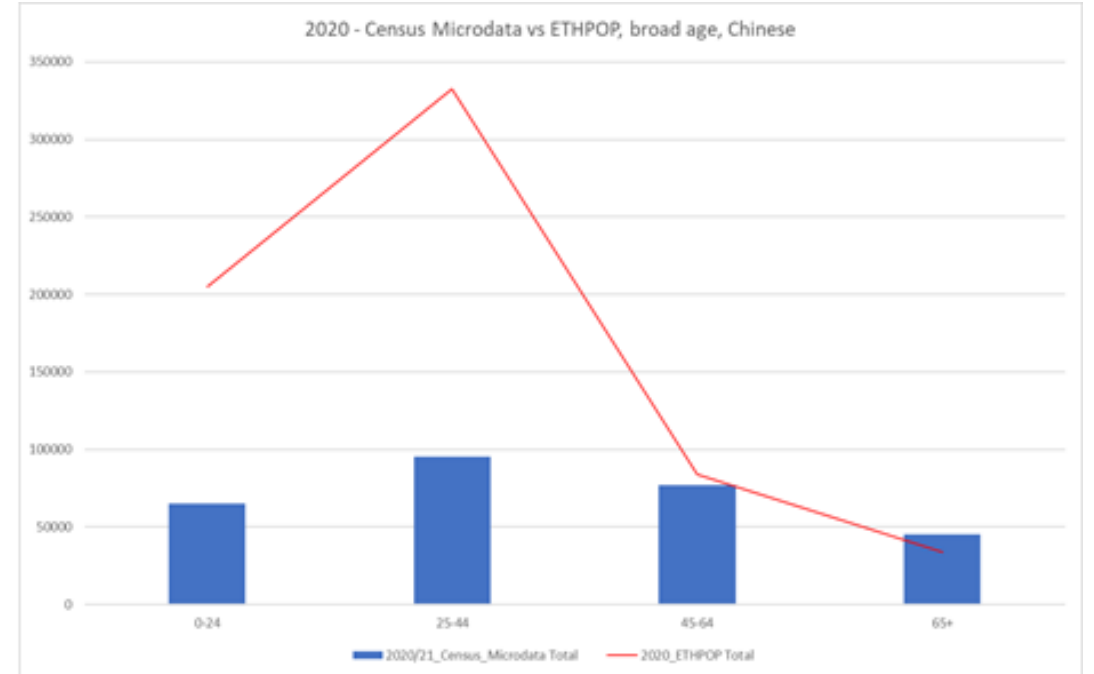

2020

Non-replenished cohort by broad age; Chinese

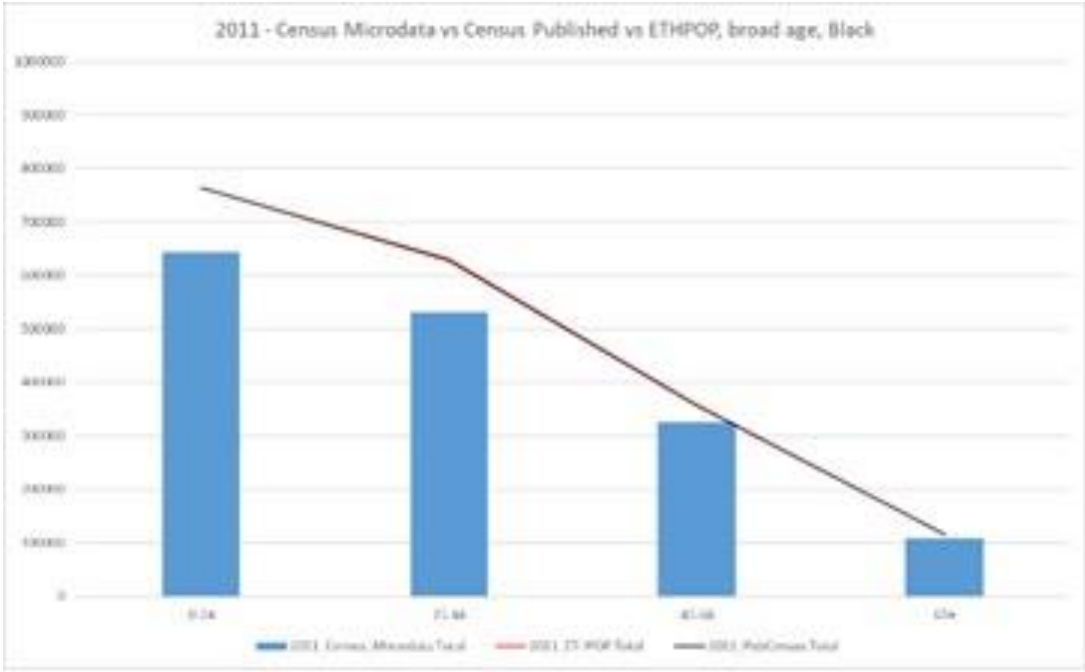

2011

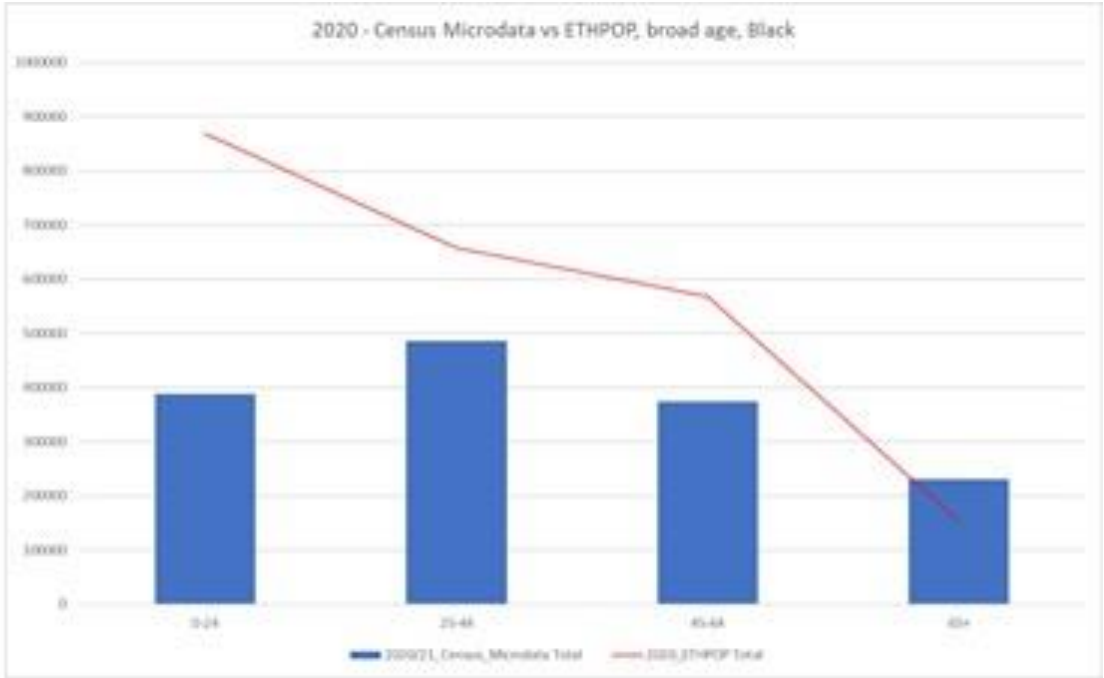

2020

Non-replenished cohort by broad age; Black

Cohort development

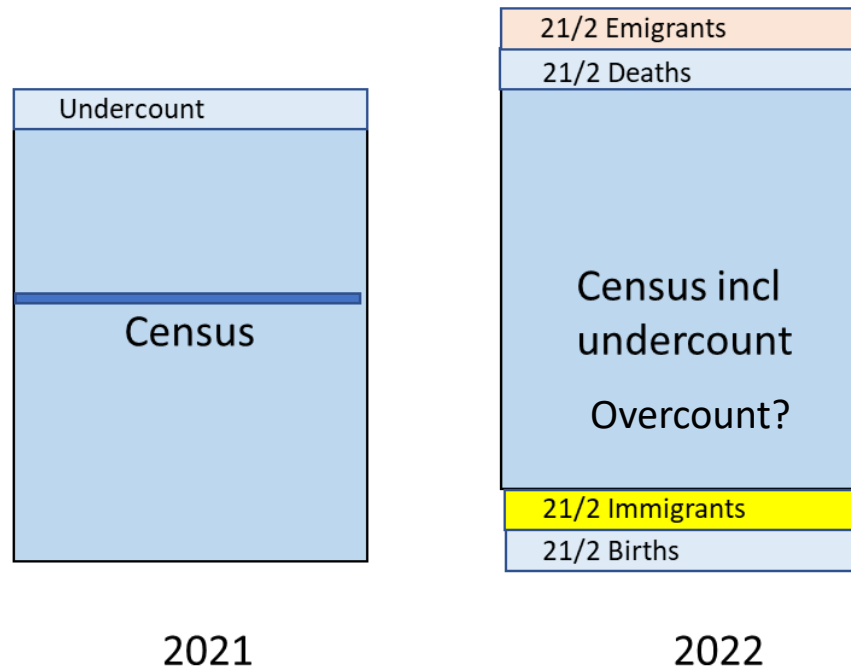

Flag potential emigrants

Adjust using weights

Admin Microdata

Cohort development

Flag potential emigrants

Adjust using weights

Admin Microdata

Cohort development

Flag potential emigrants

Adjust using weights

Admin Microdata

Cohort maintenance function. Weights then adds immigrants and flags candidate then actual emigrants, controlled to:

1. Provisional monthly estimates from Demographic Accounts
2. Finalised estimates from Demographic Accounts

Adds births, flags deaths
Cross-border flows tba

Public benefit in providing evidence on much granular basis

Potential to contribute towards informing policy, planning and delivery of local services. Identify associated impacts on society, businesses, local economies and the environment not possible through existing data sources

- Identifying populations at risk to estimate life expectancy and healthy life expectancy estimates by characteristics and occupation.
- Changes in morbidity and mortality at a local area across population groups e.g. by ethnicity, occupation, industry, children in care
- Experiences in life, set against characteristics, lived experiences and behaviours at local level levels.
- Build capability to produce fully inclusive statistics on the whole population, not just private households, but people living in communal establishments, travellers, circular migrants, homeless, children living in care etc
- Levelling Up – Targeted policies and resources to support communities and economic growth - Insight into where local and national services and infrastructure (transport and construction) are needed most

Confidentiality/Data Security

- Draw lessons from ONS Longitudinal Study
- Use for research and statistical purposes only. Estimation used as there will be under-coverage
- Study is not concerned with individuals; identifying information is being used for linking only
- Details of the data shares published on ONS website with information on how we use data and how we keep it secure
- Separation of roles for access to identifiable data and de-identified data
- Analysis dataset will be anonymised
- NHS data ONS receives is not subject to opt-outs and consent of individuals is not required as the data being used has already been collected
- Data held within the secure DAP project area for as long as they are needed for ONS research and statistical purposes
- Published research will have been through strict disclosure control procedures
- Full Cohort: Project Board to endorse research proposals. User support team to apply disclosure control and guidance on use of data. Only approved researchers able to access data

Public views and engagement

- Learn from ONS & HO engagement on public acceptability of data linkage
- Learn from 2021 Census and engage with community groups on public and statistical benefits of such a study
- Communicate outcomes from proof of concept and engage with key audiences and community groups
- Respond to feedback transparently by publishing outcomes from any engagement for the full cohort study

Legal compliance

- Undertaking a DPIA for proof of concept
- Ensure data and methods we employ are consistent with legal requirements under data protection legislation
- Legal gateways exist to receive and process the data (SRSA, Census Act 1920)
- Engage with legal team and data suppliers to ensure data sharing agreements reflect planned use of data

Feedback from NSDEC

- We welcome feedback and guidance at this early stage
- We plan to bring an application to NSDEC in July for the Proof of Concept (PoC)
- We plan to share outcomes from the PoC with the Committee
- And also regularly engage to the develop of the full 2021 Census Cohort Study, if the PoC is successful
