Can't comment on the problems of using it in Notes, but the "ain't ERMS awful, so let's put it off a bit" side of things should be countered by the 2 year from date of creation maximum that's mentioned.

One to discuss tomorrow, I guess?

Initially I had a bit of a chill hearing this one, not just because of the inevitable pretend modifications that would happen just to extend the time and for no other reason but because the Last Modified attribute is very iffy e.g. from the Notes Help

@Modified
Returns a time-date value indicating when the document was last edited and saved.
Syntax
@Modified

Re: Link Message: Ideas for new system / BDB changes v4

Return value

lastModified

Time-date. The date when the current document was last modified.

Usage

@Modified works correctly in column formulas and computed-for-display formulas.

When used in computed fields, @Modified returns a value representing the next -to-last time the document was saved. For example, if you modified and saved a document on the mornings of May 5th and 6th, then accessed the document in the afternoon on May 6th, the @Modified computed field would return the May 5th modification date, since the 5th was the next-to-last time the document was saved.

This function does not work in navigators, mail agent, paste agent, hide-when, section editor, or form formulas.

I suspect that this adds a lot of scope for problems and sounds suspiciously like going along with the "ain't ERMS awful, so let's put it off a bit" reasoning e.g. on Idea St

Hi 

Promise this is the last one (I think  mentioned our change of mind to you already!) but we're looking to alter the trigger date for the whole notification / declaration process.

Main changes in the document is the bit in the red box, and the addition of some text in Records > Suggestion 1.

Let me know if you need anything else, but otherwise we'll meet tomorrow and thrash it out then.

Cheers!
