

Revisions to Workforce Jobs April 2013

Abstract

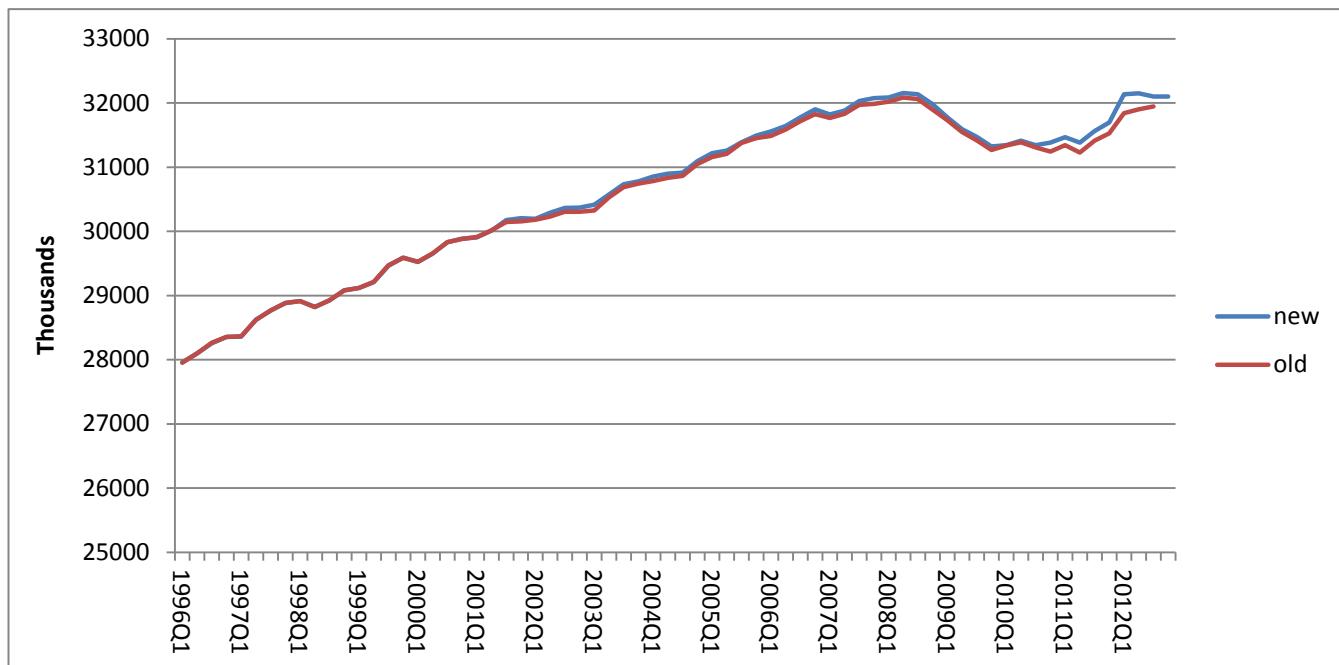

This article explains the improvements and revisions to the Workforce Jobs (WFJ) series, released by the Office for National Statistics (ONS) on 17 April 2013 in the *Labour Market Statistical Bulletin*.

Workforce Jobs is a quarterly measure of the number of jobs in the United Kingdom (UK) and is the preferred measure of the change in jobs by industry. It is a compound source that draws on a range of employer surveys, household surveys and administrative sources. WFJ is the sum of employee jobs (EJ) measured primarily by employer surveys (predominantly the Short-Term Employment Surveys (STES) and the Quarterly Public Sector Employment Survey (QPSES)), self-employment jobs (SEJ) from the Labour Force Survey (LFS), and government-supported trainees (GST) and Her Majesty's Forces (HMF) from administrative sources (see **Annex A**). A variety of outputs by industry, region, gender and full/part-time status are produced for a range of publications and users.

Developments in the methods used to produce estimates of workforce jobs over the period March 2010 to March 2012 can be found in previous articles. This article explains, in detail, the improvements that have been made to WFJ outputs since March 2012 and the revisions that have been made to the WFJ series as a result of:

- benchmarking to the latest estimates from the annual Business Register and Employment Survey (BRES); these revisions will go back to 2008,
- bringing WFJ in line with the BRES in the treatment of directors of limited companies as employees rather than self-employed,
- an improved methodology for linking short-term employment growth onto the latest BRES benchmark,
- bringing the estimates into line with the latest estimates of Public Sector Employment,
- re-weighting of series sourced from the Labour Force Survey (LFS),
- the introduction of estimates for Activities of Households as Employers, etc. (Standard Industrial Classification 2007 (SIC 2007) Section T),
- changes to seasonal parameters following a seasonal adjustment review.

Figure 1 compares the previously published and revised UK Workforce jobs (seasonally adjusted).

Figure 1 Previously published versus revised UK seasonally adjusted Workforce jobs

Benchmarking GB Employee Jobs to the Business Register Employment Survey

Benchmarking is an annual process to align the quarterly GB EJ series to the latest estimates from the Business Register and Employment Survey (BRES). BRES is based on a sample of approximately 80,000 reporting units¹, a much larger sample than STES, and so generally is considered to produce more accurate and detailed estimates of the level of employment. BRES estimates refer to Q3 of a given year. The private sector element of GB EJ series has been benchmarked to the equivalent from BRES for the periods Q3 2008, Q3 2009, Q3 2010 and Q3 2011 (the latest period available).

Treatment of directors of limited companies

Changes in the treatment of directors of limited companies in BRES 2011 have led to a discontinuity between the 2010 and 2011 BRES results. As described in a recent [discontinuity article](#)¹, cognitive testing carried out by ONS has shown that directors of limited companies often consider themselves to be in the working owner category. However, it is clear from HMRC guidance that these should be classified as employees of the company. This has led to an approximate underestimate in BRES private sector EJ of just under 500 thousand (based on 2010 data).

¹ Reporting units hold the mailing address to which survey forms are sent. The form can cover the enterprise as a whole, or parts of the enterprise identified by lists of local units.

Further testing has shown that the estimated number of directors of limited companies from the Labour Force Survey who classify themselves as self-employed is between 400 and 500 thousand. Therefore from Q4 2010 onwards, the SEJ series have been recalculated to remove this element, whilst the revised (higher) BRES figures are used to benchmark EJ. Prior to Q4 2010, the 2010 BRES discontinuity has been adjusted for each respective period ensuring that it changes over time in line with total SEJ. It has then been added to EJ and removed from SEJ. This method was chosen as the required information from LFS was not available for earlier periods, and to avoid revisions to total WFJ back to the start of the series. There is now a slight discontinuity in WFJ and SEJ at Q4 2010 where the source of the ‘misclassified directors’ changes from BRES to LFS.

Linking short term growth onto latest BRES benchmark

The way in which STES data are linked on to the latest benchmark at regional level has been improved by linking at the level of region by industry section. Previously, industry level series from STES had been linked onto BRES at GB level and subsequently broken down by region, leading to small level shifts in some region by industry section series at the period after the latest benchmark (Q4 2010). The change in the linking method has removed these shifts, resulting in more accurate and comparable time series. A similar methodology change has improved estimates by gender and working pattern.

Changes to estimates of Public Sector Employment

Workforce Jobs makes use of ONS’s official public sector employment (PSE) estimates for GB. These inputs are not benchmarked as they are the definitive measure of PSE. PSE estimates were revised at Q3 2012 and these revisions have now been applied to WFJ inputs. Revisions go back to 1991, are predominantly in sections O, P and Q, and include an improved method for estimating employment of academies in England. Further information is available in the [Q3 2012 PSE Statistical Bulletin²](#) and in the article [Change in Method for Estimating Employment in Education in England³](#)

Re-weighting of LFS estimates

The Labour Force Survey is used to measure SEJ. It is also the source of EJ estimates for agriculture, activities of households as employers (see next section), and construction up to Q3 2010. The LFS was re-weighted in May 2011 with revised series being produced back to 2001 and again in May 2012 with further revisions produced back to 2009. Revisions have been taken on for all domains.

Introduction of estimates for Activities of Households as Employers, etc.

Workforce Jobs now includes estimates for activities of households as employers, sourced from the LFS. Historically, this category of jobs has been omitted from EJ as they fall out of the scope of business surveys. It is now included with the aim of providing a more complete measure of the UK labour market. Estimates are included from 2001, which is the earliest available period. Previously, section T was included in the SEJ component under the category ‘other services’.

Seasonal Adjustment

Seasonal adjustment is the process of identifying and removing the seasonal components from a series to leave the underlying trend and irregular components. The revised WFJ series have undergone a seasonal adjustment review, by ONS's Time Series Analysis branch, causing revisions back to Q3 1981. As part of this review, an improvement to the seasonal adjustment methodology has also been made. Previously, seasonal parameters were calculated for each industry at UK level and applied to each region. Industry level parameters are now calculated and applied separately for each region. The WFJ system seasonally adjusts using X12 ARIMA.

Government Supported trainees (GSTs)

The Department for Business, Innovation and Skills (BIS) and the devolved administrations provide the information for these series and small revisions have been taken on.

Northern Ireland jobs

Employee jobs estimates for Northern Ireland are provided by the Department of Finance and Personnel - Northern Ireland (DFPNI). Data have been revised back to 2009 Q4.
